CONSTRUCTION QUALITY ASSURANCE CERTIFICATION
BAKER BEACH DISTURBED AREAS 3 AND 4

The construction quality assurance (CQA) activities discussed and documented in this Construction Completion Report for Baker Beach Disturbed Areas 3 and 4 have been performed by and under the supervision of the CQA Officer, Mr. Wendell L. Minshew, P.E., a civil engineer registered in the State of California. The information presented in this report is accurate to the best of the CQA Officer's knowledge.

Based on the monitoring observations and test results presented in this report, the CQA program has been implemented as proposed and the site remediation activities have been constructed in compliance with the Remedial Action Plan, Construction Plans and Specifications, approved design changes, good engineering and construction practices, and the applicable requirements of Title 22, CCR Section 66264.19.

Work Plan	*Work Plan to Implement the Remedial Action Plan for Baker Beach Disturbed Areas 3 and 4*

1.0 INTRODUCTION

On behalf of The Presidio Trust (Trust), Treadwell & Rollo, Inc. (Treadwell & Rollo) has prepared this report, which summarizes the remedial action activities performed at former Baker Beach Disturbed Area 3 (BBDA 3) and Baker Beach Disturbed Area 4 (BBDA 4) located in the Presidio of San Francisco, California (Figure 1). The remedial action consisted of excavating and removing non-native waste fill materials (artificial fill soils, tree stumps and wood waste, construction debris, and municipal waste), disposing of the waste fill material, and preparing the resulting slopes for re-vegetation planting.

The work was performed in accordance with the *Work Plan to Implement the Remedial Action Plan for Baker Beach Disturbed Areas 3 and 4* (Work Plan) (Treadwell & Rollo, 2004d), which outlines the technical scope of work required to implement the recommended remedial alternative for BBDA 3 and BBDA 4 described in the *Remedial Action Plan for Fill Site 6A and Baker Beach Disturbed Areas 3 and 4* (RAP) (Treadwell & Rollo, 2004a). *The Construction Plans and Specifications* (Minshew Engineering and Treadwell & Rollo, 2004), which included the *Construction Quality Assurance (CQA) Plan* for the project, were prepared concurrently with the Work Plan and the *Slope Stability Evaluation Report for Baker Beach Disturbed Area 3* (Treadwell & Rollo, 2004b). The remediation documents were reviewed and approved by the California Environmental Protection Agency, Department of Toxic Substances Control (DTSC) and the California Regional Water Quality Control Board (RWQCB).

1.1 Background

The Presidio of San Francisco (Presidio) is located in the City of San Francisco, at the northern tip of the San Francisco peninsula. The Presidio occupies approximately 1,480 acres and is bounded by San Francisco Bay on the north and the Pacific Ocean on the west. Densely populated residential areas of San Francisco border the Presidio to the south and east.

The Presidio was a United States Army (Army) installation from 1848 through 1994, serving as a mobilization and embarkation point during several overseas conflicts, a medical debarkation center, and a coastal defense for the San Francisco Bay area. Industrial operations formerly performed at the Presidio were associated with maintenance and repair of vehicles, aircraft and base facilities. The Presidio also contains landfills used by the Army for the disposal of municipal waste and construction debris.

In December 1988, the U.S. Secretary of Defense's Commission on Base Realignments and Closure recommended closure of the Presidio. Under Public Law 92-589, the Presidio was transferred to the National Park Service (NPS) on October 1, 1994 and became part of the Golden Gate National Recreation Area (GGNRA). In accordance with the Base Realignments and Closure Act, the Army initiated environmental studies in conjunction with the transfer of the Presidio to the NPS. The NPS operated the Presidio between 1994 and 1998. In 1996,

Section 103 of the Omnibus Parks and Public Lands Management Act of 1996, Public Law 104-333, 110 Stat. 4097 (Trust Act) created the Presidio Trust. The Trust assumed responsibility for managing the leasing, maintenance, rehabilitation, and improvement of Area B (the non-coastal portions of the Presidio) in 1998. The NPS retained administrative responsibility for Area A of the Presidio (the coastal portions of the Presidio). Figure 1 indicates the locations of Area A and Area B of the Presidio. As shown on Figure 1, BBDA 3 and BBDA 4 are both located within Area A.

On 24 May 1999, the Army, the Trust, and NPS entered into a Memorandum of Agreement (MOA). Pursuant to this MOA, the Army delegated to the Trust its authority and responsibility for the remediation of contamination at the Presidio (both Areas A and B).

BBDA 3 and BBDA 4 are located in Area A of the Presidio, and therefore are subject to land uses established by the General Management Plan Amendment (GMPA) (NPS, 1994). Based on principles contained in the GMPA, land use at both BBDA 3 and BBDA 4 is designated as open-space recreational (Erler & Kalinowski, Inc.(EKI), 2003). BBDA 3 and BBDA 4 are located within the Coastal Bluffs planning zone of the GMPA. Federally endangered and rare plant species are located in the serpentinite outcrops east of Battery Crosby (Figure 2). Therefore, as presented in the RAP, land uses for both BBDA 3 and BBDA 4 are open-space recreational and ecological special status.

The “clean closure” remedy selected in the RAP and implemented at BBDA 3 and BBDA 4 is intended to be the final, permanent remedy for these areas. The RAP was prepared in consultation with the stakeholders, including:

- The Presidio Trust;
- Department of the Interior, NPS;
- DTSC;
- RWQCB;
- Community members of the Restoration Advisory Board; and
- Public comment.

1.1.1 Site Background

This section presents the site physical settings and a brief summary of previous investigation results. A detailed discussion of site history and previous investigation results is presented in the RAP (Treadwell & Rollo, 2004a).

1.1.1.1 Baker Beach Disturbed Area 3

The area in the vicinity of BBDA 3 and BBDA 4 is a steeply sloping bluff with a narrow beach (Baker Beach) at its base. Surface drainage in the area is toward the west to the Pacific Ocean. Vegetation in the area consists of grasses, shrubs, and trees.

BBDA 3 is located along the western edge of the Presidio within the ravine south of Battery Crosby (Figure 2). Battery Crosby is north of the site, and, prior to remedial activities, the access road for the battery off Lincoln Boulevard bisected the site (Figure 3). The material in BBDA 3 is composed primarily of soil and debris fill containing concrete, asphalt, and metal debris. Buttress fill material, consisting mainly of sand (fill sand) was initially placed in BBDA 3 along Lincoln Boulevard and along the access road to Battery Crosby (Dames & Moore, 1997). As presented in the RAP, based on initial review of aerial photographs, BBDA 3 received fill material intermittently between 1948 and 1973. However, recently identified areal photographs show additional dumping of debris until at least 1979 (California Coastal Records Project, 2005).

BBDA 3 lies at the boundary of two geologic regimes. The northern portion is predominantly Franciscan Formation overlain by landslide deposits on the bluff faces, with Colma and Dune Sand at the bluff tops. South of BBDA 3, the bluffs are covered almost entirely by Quaternary dune sand (Schlocker, 1974). BBDA 3 is located near the southern boundary of the Coastal Bluffs Groundwater Basin (Figure 2).

Geologic data were initially obtained from shallow hand-augured borings during the Army's Remedial Investigation (RI) and later from additional, deeper borings as part of an additional investigation by the Trust (EKI, 2000). Additional physical and chemical characterization of the waste was performed by the Trust in 2003 by means of a test pit program documented in *Technical Memorandum: Historical Battery Crosby Road and Lead Exploratory Test Pit Excavation Observations and Results* (Treadwell & Rollo, 2004e). Waste fill at BBDA 3 was estimated in the RAP to vary in thickness from less than one foot to a maximum depth of approximately 20 feet, and the volume of fill material in BBDA 3 prior to remedial excavation was estimated to be 33,000 cubic yards (cy).

Analytical results for soil testing associated with previous investigations are presented in the RAP. In general, these results indicated that primary chemicals detected within BBDA 3 included metals, pesticides, and polychlorinated biphenyls (PCBs).

An ephemeral seep flowed at the bottom of the ravine below BBDA 3. Historical surface water monitoring data for BBDA 3 are presented in the RAP. In May 2000, the Trust collected water samples from the shallow subsurface of the area and analyzed the samples for inorganics, total petroleum hydrocarbons (TPH) as gasoline (TPHg), total petroleum hydrocarbons as diesel (TPHd), benzene, toluene, ethylbenzene, and xylenes (BTEX), volatile organic compounds

(VOCs), organochlorine pesticides (OCPs), PCBs, and chlorinated herbicides. One of the seep samples was found to contain TPHd at 77 micrograms per liter (μg/L) (EKI, 2000).

Prior to excavation activities and at the request of DTSC, the Trust performed a slope stability analysis at BBDA 3 in early 2004 to determine whether removal of the waste fill material at the site might undermine the structural fill buttress supporting Lincoln Boulevard east of Battery Crosby Road. The findings of this investigation are documented in the *Slope Stability Evaluation Report, Baker Beach Disturbed Area 3* (Treadwell & Rollo, 2004b). As recommended in that report, the stability of the slope supporting Lincoln Boulevard was monitored during excavation of waste materials at BBDA 3 as described in Section 3.2.1.

A pair of temporary piezometers were installed and monitored as part of the slope stability evaluation. Groundwater was found to be present in dune sand and weathered serpentinite bedrock (Treadwell & Rollo, 2004b). Surface water drainage and groundwater flow appears to follow the general topographic trend, to the west and toward the Pacific Ocean. As documented in the RAP, it was anticipated that removal of the fill material could alter the location(s) of the freshwater seep(s) located at the western boundary of BBDA 3.

1.1.1.2 Baker Beach Disturbed Area 4

The material in BBDA 4 is composed primarily of artificial fill containing concrete rubble and masonry debris that was used to stabilize a portion of Lincoln Boulevard. Fill material was apparently placed in BBDA 4 until 1955. Some erosion of the fill material downslope into the drainage channel has apparently occurred since then (EKI, 2003).

BBDA 4 is located in the northwestern corner of the Lobos Groundwater Basin (Figure 2). BBDA 4 is covered entirely by Quaternary dune sand (Schlocker, 1974). At BBDA 4, artificial fill was previously estimated to range between 1 and 5 feet in thickness. The estimated volume of impacted fill material in BBDA 4 prior to remedial excavation was approximately 180 cy.

Analytical results for BBDA 4 soil testing summarized in the RAP indicate that primary chemicals detected within BBDA 4 included metals, pesticides, and TPHd.

No groundwater was encountered in any of the Army or Trust borings at BBDA 4 and no freshwater seeps are present (EKI, 2003). Surface water drainage and groundwater flow is assumed to follow the general topographic trend, to the west and toward the Pacific Ocean.

No surface water or groundwater samples have been collected at BBDA 4 because soil sampling results and hydrogeologic conditions at the site were determined not to warrant further groundwater investigation or monitoring.

1.2 Remedial Action Requirements

The RAP was prepared and implemented in accordance with the terms of the Consent Agreement between the Trust, DTSC, and NPS (DTSC, Trust, and NPS, 1999).

As outlined in the RAP, the remedial action objectives for the remedy to be conducted at BBDA 3 and BBDA 4 were:

- Protection of human health and the environment;
- Cost-effective cleanup of the sites consistent with their intended reuse for open space, recreation, and protection of special status species;
- Consistency of the selected remedial alternative for each site with the overall transformation of the Presidio into a national park;
- Recycling or reuse of landfilled materials from BBDA 3 to the extent practicable;
- Compliance with applicable or relevant and appropriate requirements (ARARs) and "to be considered" requirements (TBCs); and
- Preference for permanent ("clean closure") remedies wherever practicable, cost-effective, and consistent with future land use.

Excavation, recycling, and off-site disposal of waste fill and contaminated soil was the selected remedial alternative to be implemented at BBDAs 3 and 4, with three years of post-closure groundwater and surface water monitoring at BBDA 3. In order for the remedial action for the site to be achieved and to comply with ARARs, the remediation had to meet the applicable cleanup levels developed for the contaminants of concern (COCs). ARARs are laws, requirements, or other cleanup standards that pertain to the chemical release at a site. The RAP provides a detailed explanation of the process used to develop cleanup levels for the two sites. For any given site, the applicable cleanup level incorporates the planned human use (residential, recreational, or institutional), the predominant soil or sediment lithology, potential ecological species present (including the presence of special status species), regulatory requirements, and in limited cases, laboratory detection limits. Site-specific soil and groundwater cleanup levels for BBDA 3 and BBDA 4 are discussed in Section 2.0.

In accordance with the Work Plan and CQA Plan, confirmation sampling was performed to ensure that the material left in place meets applicable cleanup levels for each COC relative to the planned land uses and protection of ecological receptors (Tables 1A, 1B, and 2). During construction, if a particular confirmation sample result exceeded a soil cleanup level, one of the following occurred:

- Soil was excavated in the area of elevated concentration(s) and resampled in the newly excavated area in accordance with the sampling strategy in the RAP and outlined in Section 3.0 of this document; or

- The 95% upper confidence limit (UCL) calculation was performed in cases where cleanup goals could not be achieved through further excavation and only for limited metals exceedances (see Section 3.2.4.3).

Site excavation and soil confirmation sampling continued until the cleanup levels were achieved or remaining exceedances were determined to be within the 95% UCL. Confirmation sampling results are presented and discussed in detail in Section 3.0.

The vegetation restoration at both sites is continuing. To stabilize the slopes prior to the establishment of plant communities, temporary surface drainage and erosion control measures were required. Such measures included the installation of straw wattles, silt fences, erosion control mats, and, in the case of BBDA 3, sand bag check dams. Surface water pollution prevention measures were also implemented, including erosion control, as described in the *Storm Water Pollution Prevention Plan* (SWPPP), *Baker Beach Disturbed Areas 3 and 4* (Treadwell & Rollo, 2004c) and in accordance with the California Environmental Protection Agency, State Water Resources Control Board (SWRCB) general discharge permit (Water Quality Order 99-08-DWQ, National Pollutant Discharge Elimination System [NPDES] General Permit for Storm Water Discharges Associated with Construction Activity).

In accordance with the RAP and Work Plan, three years of post-closure groundwater monitoring are required under the selected remedial alternative for BBDA 3. Upon completion of the excavation and soil confirmation sampling, two groundwater monitoring wells, one piezometer, and three fixed water monitoring points were installed to enable monitoring of groundwater and surface water conditions at BBDA 3. The groundwater monitoring well, piezometer, and fixed water monitoring point sampling results for the initial sampling event are included in this document and presented in the *Semi-Annual Groundwater Monitoring Report, Third and Fourth Quarters 2004, Presidio-wide Groundwater Monitoring Program* (Treadwell & Rollo, 2005a). Subsequent sampling events will be documented in future Semi-Annual Groundwater Monitoring Reports.

2.0 REMEDIAL ACTION APPROACH

2.1 Cleanup Levels

Cleanup levels for native soils at BBDA 3 and BBDA 4 were established in the RAP and are shown in Tables 1A, 1B, and 2 of this document. The cleanup levels for soil, groundwater, and surface water at BBDA 3 and BBDA 4 presented in the RAP are based on the process presented in the *Development of Presidio-wide Cleanup Levels for Soil, Sediment, Groundwater, and Surface Water* (Cleanup Levels Document) (EKI, 2002). The applicable cleanup levels incorporate the planned human land use (recreational), the predominant soil or sediment lithology, potential ecological species present (including the presence of special status species), and RWQCB Order R2-2003-0080 requirements (RWQCB, 2003).

BBDA 3 and BBDA 4 standards are generally based on cleanup levels that are protective of human health (recreational use) or of special status species ecological receptors, whichever standard is more stringent. However, because the applicable ecological cleanup levels are generally quite stringent, the RAP identified the residential (as opposed to the slightly less stringent recreational) criteria as the "target" cleanup levels for the protection of human health. In the event that post-excavation confirmation sampling had revealed that residential cleanup levels could not be met, the recreational cleanup levels would have applied, and appropriate land use controls would have been developed and implemented.

During the course of the remedial fieldwork at BBDA 3, it became necessary to collect confirmation samples in materials not anticipated during the preparation of the RAP. The RAP assumed that all confirmation samples would be collected in native soil, which was anticipated to include beach/dune sand, Colma formation soils, and serpentinite lithologies. In actuality, samples were also collected from material classified as "engineered road fill" and from a road bed constructed of imported (non-native) chert. For the engineered road fill, laboratory analytical data for metals were compared to the cleanup criteria for serpentinite because serpentinite fragments were present in these samples. For the roadbed chert samples, applicable cleanup levels were determined using the Cleanup Levels Document cleanup criteria for chert. These cleanup levels are also included in Table 1A.

2.2 COCs

As presented in the RAP, the chemicals retained as COCs in soil at BBDA 3 were cadmium, cobalt, lead, zinc, 4,4'-DDT (1,1,1-trichloro-2,2-di(4-chlorophenyl)ethane), chlordane (including chlordane, alpha-chlordane, and gamma-chlordane), dieldrin, and PCB1254. Although no compounds were identified as COCs for groundwater at BBDA 3, the RAP committed to monitoring groundwater for potential impacts from metals and TPH (including diesel, gasoline, and fuel oil components).

Lead, zinc, 4,4'-DDT and chlordane (including chlordane and gamma-chlordane) are the COCs for BBDA 4 soil identified in the RAP. No groundwater COCs were identified in the RAP for BBDA 4.

2.3 Sampling and Analyses

Soil confirmation samples were collected to ensure that material left in place at BBDAs 3 and 4 meets the applicable site cleanup levels.

2.3.1 Soil Sampling and Analyses

In accordance with the Work Plan, soil confirmation samples were collected from the bottom of the excavations on a site-specific grid spacing. Perimeter samples were collected at a rate of one per approximately every 75 linear feet. Because the excavations were situated in ravines, generally no excavation "sidewalls" existed. All sampling was performed in accordance with the RAP, CQA Plan, and *Presidio-wide Quality Assurance Project Plan and Sampling and Analysis Plan* (QAPP) (Tetra Tech EM, Inc., 2001). Sample designations refer to the site, the sequential soil sample number, and the sample depth. For example, sample BB3EX100[0.5] refers to BBDA 3, first excavation sample location, collected from 0.0 to 0.5 feet below ground surface (bgs), and BB4EX104[0.5] refers to BBDA 4, fifth excavation sample location, collected from 0.0 to 0.5 feet bgs. Table 3A and 3B present the confirmation soil sampling and analyses performed during remedial activities at BBDA 3 and BBDA 4, respectively.

Soil confirmation samples were collected in one of two ways. The majority of the samples were collected by pushing a new 2-inch-diameter by 6-inch-long, stainless steel sample tube into the native sand by hand. The filled sample tube was retrieved and sealed with Teflon™, capped, labeled, and placed on ice in an insulated container. The second method of sample collection was used to sample hard materials such as the engineered fill or chert roadway material. As outlined in the Trust's Standard Operating Procedure (SOP) No. 001, Soil Sampling, these samples were collected by pushing a 2-inch-diameter by 6-inch-long, stainless steel, sample tube into the material excavated in the excavator bucket. The sample tube was then sealed and labeled as noted above and placed on ice. Duplicate soil samples were collected by pushing a new sample tube into the material adjacent to the prime sample location or from the same excavator bucket, depending upon the sampling method used. All samples were delivered to Curtis & Tompkins, Ltd. (C&T) in Berkeley, California, a California-certified laboratory, under chain-of-custody protocol for analysis.

In accordance with the RAP, all soil confirmation samples for BBDA 3 were analyzed for:

- Metals (antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, nickel, selenium, silver, thallium, vanadium, and zinc) by U.S. Environmental Protection Agency (EPA) Method 6010B;

- OCPs by EPA Method 8081; and
- PCBs by EPA Method 8082.

Additionally, ten percent of all samples collected were analyzed for a broader range of compounds to protect against uncertainties resulting from the limited site characterization. The expanded analytical suite included:

- Mercury by EPA Method 7471;
- VOCs by EPA Method 8260B;
- Semi-volatile organic compounds (SVOCs) by EPA Method 8270C;
- Chlorinated herbicides by EPA Method 8150; and
- TPHd (carbon range C_{12}-C_{24}) and total petroleum hydrocarbons as fuel oil (TPHfo) (carbon range C_{24}-C_{36}) by EPA Method 8015 modified, prepared using silica gel cleanup (EPA Method SW3630A).

All soil confirmation samples at BBDA 4 were analyzed for:

- Metals (antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, nickel, selenium, silver, thallium, vanadium, and zinc) by EPA Method 6010B; and
- OCPs by EPA Method 8081.

Additionally, ten percent of all samples collected were analyzed for a broader range of compounds to protect against uncertainties resulting from the limited site characterization. The expanded analytical suite included:

- Mercury by EPA Method 7471;
- VOCs by EPA Method 8260B;
- SVOCs by EPA Method 8270C;
- PCBs by EPA Method 8082;
- Chlorinated herbicides by EPA Method 8150; and
- TPHd (carbon range C_{12}-C_{24}) and TPHfo (carbon range C_{24}-C_{36}) by EPA Method 8015 modified, prepared using silica gel clean-up (EPA Method SW3630A).

To fulfill the requirements of the QAPP, duplicate soil confirmation samples were collected and analyzed at a rate of ten percent. The laboratory provided EPA Level III data report packages with ten percent at Level IV documentation. The analytical results of soil confirmation samples were validated in a manner consistent with the QAPP for parameters such as accuracy, precision, and representativeness as discussed Section 2.4.

2.3.2 Groundwater and Surface Water Sampling and Analyses

Two groundwater monitoring wells, one piezometer, and three fixed water monitoring points were installed at BBDA 3. In accordance with the RAP, wells or monitoring points were not installed at BBDA 4. Groundwater monitoring and sampling at BBDA 3 was conducted as part of the Presidio-wide Groundwater Monitoring Program for the Fourth Quarter 2004. Groundwater level monitoring was performed at BBDA 3 on 13 December 2004, groundwater sampling was conducted on 14 December 2004, and surface water sampling on 16 and 17 December 2004. All sampling was performed in accordance with the QAPP. Sampling methods and analytical results are presented in Section 4.0.

All samples were delivered to Curtis & Tompkins, Ltd. (C&T) in Berkeley, California, a California-certified laboratory, under chain-of-custody protocol for analysis.

Groundwater sample analysis was performed in accordance with the RAP and included:

- TPHg (carbon range C_7-C_{12}), TPHd (carbon range C_{12}-C_{24}) and TPHfo (carbon range C_{24}-C_{36}) by EPA Method 8015 modified, prepared using silica gel clean-up (EPA Method SW3630A);
- 23 Metals (aluminum, antimony, arsenic, barium, beryllium, cadmium, calcium, chromium, cobalt, copper, iron, lead, magnesium, manganese, molybdenum, nickel, potassium, selenium, silver, sodium, thallium, vanadium, and zinc) by EPA Method 6010B;
- Mercury by EPA Method 7470;
- General Chemistry Analyses including: total alkalinity, bicarbonate, chloride, fluoride, nitrogen as nitrate, nitrogen as nitrite, sulfate, and Total Dissolved Solids (TDS) by EPA Methods 300.0, 310.1, and 160.1; and
- Dissolved oxygen by direct field measurement.

To fulfill the requirements of the QAPP, duplicate groundwater samples were collected and analyzed at a rate of ten percent. The laboratory provided EPA Level III data report packages with ten percent at Level IV documentation. The analytical results of groundwater samples were validated in a manner consistent with the QAPP for parameters such as accuracy, precision, and representativeness as discussed Section 2.4.

2.4 Data Validation

2.4.1 Data Validation Parameters and Data Qualifiers

DataVal of San Rafael, California, reviewed both the electronic data and paper laboratory reports for the soil confirmation samples and groundwater samples, which are included in Appendix A. The data validation reports for soil and groundwater samples are included in Appendix B. The report includes an evaluation of the relative percent differences (RPDs) for the duplicate samples as well as the following quality control (QC) data, as applicable, for each analytical method.

- Reporting Limits
- Holding Times
- Target Blanks
- Gas Chromatograph/Mass Spectrometry (GC/MS) Equipment Tunes
- Initial Equipment Calibration
- Continuing Calibration Verification (CCV) Standards
- Performance Evaluation Mix (PEM) Standards
- Matrix Spikes/Matrix Spike Duplicates (MS/MSD)
- Laboratory Control Samples (LCS)
- Inductively coupled plasma (ICP) interference check standards
- ICP serial dilutions
- Compound identification and quantitation
- Field duplicates
- Surrogate Recoveries
- Internal Standards

The following data validation qualifiers used by DataVal and shown in the tables in this report are those recommended in the October 1999 document titled *USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review*:

J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample. A minus sign (-) indicates that the numerical value has a low bias. A plus sign (+) indicates that the numerical value has a high bias.

UJ The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

2.4.2 Overall Data Quality

Data validation of Level III and Level IV laboratory data packages was performed according to the project-specific guidelines. The data validation process did not result in any soil or groundwater data being rejected, and the data as a whole are usable as reported with added qualifiers. Reporting limits for all soils were raised due to dry weight correction. Any problem areas in the data, such as elevated reporting limits and added data qualifiers, for each analysis are presented in Section 3.2.4.4 for BBDA 3 soil, Section 3.3.2.4 for BBDA 4 soil, and Section 4.4.4 for BBDA 3 groundwater, respectively.

3.0 EXCAVATION ACTIVITIES

With the exceptions noted in Section 5.0, the remedial excavation activities were conducted in general accordance with the Work Plan and Construction Plan and Specifications and as requested by the DTSC and RWQCB. The soil excavation activities at the two sites were performed within the same timeframe. BBDA 3 excavation activities were generally conducted between July and December 2004. BBDA 4 activities began in late September and were completed in early October 2004. Following the excavation activities at BBDA 3, groundwater monitoring wells and fixed water monitoring points were installed and quarterly groundwater monitoring began. Table 4 presents a timeline for the BBDA 3 and BBDA 4 remedial activities, which are described in detail below. In compliance with the CQA Plan, all significant site activities were documented using a Construction Daily Report Form. All Construction Daily Report forms for the project, including activities at both BBDA 3 and BBDA 4, are presented in Appendix C.

3.1 General Activities

The Trust began tree removal at BBDA 3 in February 2004 and completed the tree removal in March 2004. No tree removal activities were necessary at BBDA 4 (Table 4).

The Trust contracted with Performance Excavators, Inc. (Perf-Ex) of San Rafael, California, to provide construction services including excavation and earthmoving activities. Treadwell & Rollo and Minshew Engineering performed construction oversight and Treadwell & Rollo performed all confirmation soil sampling. Notice to Proceed was issued by the Trust to Perf-Ex on 9 June 2004.

Prior to excavation activities, the Trust obtained excavation permits for the sites. The utility location survey was performed by the Trust Utilities Department.

A pre-construction meeting was held on 12 June 2004, and subsequently weekly Construction Meetings were conducted throughout the construction phase of the project to update the team regarding project status and scheduling. The meetings were generally attended by Trust, NPS, Treadwell & Rollo, Minshew Engineering, Inc., and Perf-Ex personnel. Additionally, as analytical data became available, weekly Data Meetings were held to review and discuss the available data. These meetings were attended by Trust, NPS, and Treadwell & Rollo personnel.

3.1.1 Health & Safety

On 5 May 2004, Perf-Ex issued their Health & Safety Plan (HASP) for the remediation project. The HASP included the information pertaining to potential and identified hazards and protocols necessary to protect worker and public safety during the project.

3.1.2 Site-Specific Training

As outlined in the Work Plan, prior to work at BBDAs 3 and 4, all site personnel attended a training session on the Endangered Species Act (ESA). On 28 June 2004, Mr. Lewis Stringer and Ms. Johanna Rahman with the NPS conducted an ESA training session, which included identification of local sensitive and endangered species, compliance with the ESA, and outlined the areas adjacent to the site as off-limits to site personnel during the work at the sites.

An additional training session was conducted by the Trust outlining the protocols for the discovery of unexploded ordnance (UXO) and working on a historically sensitive site. Mr. Jim Schiller with the Trust conducted an awareness training which presented the history of UXO discoveries at the Presidio, typical UXO, and protocols to follow if UXOs are found. Ms. Jennifer Yata, Trust Project Manager, conducted an awareness training that discussed the historical nature of the site, the sensitivity to preservation of historical artifacts or features, and the Trust and NPS focus on the identification and preservation of the structure and alignment of the historical (chert-surfaced) Battery Crosby Road.

3.1.3 Surveying

As outlined in the Work Plan and *Construction Plans and Specifications, Baker Beach Disturbed Areas 3 and 4, Presidio of San Francisco* (Plans and Specs) (Minshew Engineering and Treadwell & Rollo, 2004), surveying of BBDA 3 and BBDA 4 topography was to be conducted prior to excavation, after completion of excavation (including soil confirmation sample locations), and at the completion of the final slope grading. Perf-Ex contracted R.W. Davis & Associates (RW Davis), a California-licensed land surveyor to provide the surveying services. The surveys were performed in accordance with the specification requirements and the QAPP. The horizontal coordinates are based on North American Datum of 1927 (NAD27), Zone 3. The elevations are referenced to the North American Geodetic Vertical Datum of 1929 (NGVD29).

RW Davis performed the pre-excavation topography survey for both sites on 21 June 2004. The pre-construction survey included the establishment of a 75 feet by 75 feet grid across the sites which was used as a guide for the confirmation soil sample collection. The post-excavation survey, including soil confirmation sample locations and the topography following grading at BBDA 3, was conducted in stages throughout the project between 21 June and 29 November 2004. The survey was performed in stages in order to have the survey site grid intersection re-established following excavation and prior to confirmation soil sample collection. The post-excavation and final topography surveys were performed at BBDA 4 on 21 October 2004. The BBDA 3 survey results are presented on Figures 4, 5, and 8. The BBDA 4 survey results are presented on Figures 7 and 9. *[Upon completion of the reconstruction of Battery Crosby Road, the BBDA 3 site topography, including the new road alignment, will be resurveyed.]*

3.1.4 Site Earth Moving

Perf-Ex mobilized heavy equipment to BBDA 3 on 9 June 2004 and to BBDA 4 on 5 October 2004 to provide excavating, earth moving, and truck loading functions. The primary excavation activities were performed using a Caterpillar 330B L excavator, Caterpillar EL300B long reach excavator (50 feet reach), Caterpillar D7 XL dozer, Caterpillar 966G loader, and Caterpillar D350E articulated 6-wheel dump truck (Photos 1 through 3). At BBDA 3, excavation was performed primarily by visually identifying the waste fill/native material contact and removing the waste fill and placing it into stockpiles. At BBDA 3, the waste fill/native lithologic contacts were readily apparent. Excavating and grading of the waste fill continued until all of it was removed. At BBDA 4, the objective was to remove impacted fill, as identified in the RAP. Following the exposure of the native material (BBDA 3) or the removal of suspected impacted fill material (BBDA 4), the Treadwell & Rollo field geologist (CQA Monitor) collected soil confirmation samples for chemical analysis in accordance with the RAP and Work Plan. Waste fill material observations and the volumes removed from each site are presented in Sections 3.2.5 and 3.3.3. The soil confirmation sample collection and results are presented in Sections 3.2.4 and 3.3.2.

3.1.5 Stockpiling, Loading, and Disposal

Waste fill material excavation at each site was performed to allow the segregation of different types of waste. In general, waste was segregated into:

- wood waste (trees, tree stumps) for recycling;
- tires for recycling;
- vegetation and soil for Class III disposal;
- concrete for Class II disposal; and
- contaminated soil for Class III, Class II, and Class I disposal.

Prior to the start of excavation activities at each site (Sections 3.2.1 and 3.3.1), Perf-Ex excavated potholes to collect soil samples for waste profiling and to visually observe the thickness of waste and fill materials across the sites. Additionally, prior to disposal/recycling, Perf-Ex conducted waste characterization sampling of the stockpiled wastes to establish a waste profile of the material for the disposal facilities. The samples were submitted to Severn Trent Services, a California-certified laboratory, under chain-of-custody protocol. A discussion of the waste characterization sampling and results are presented in Sections 3.2 and 3.3.

The segregated stockpiled materials were loaded out by Perf-Ex and transported to the appropriate landfill/recycler by appropriately licensed trucking firms using end dump trucks. The incoming and outgoing truck traffic pattern was in accordance with the authorized haul routes presented in the RAP and Work Plan. The loading out was accomplished using Bowley

Road as the truck staging area (Photo 4). The trucks arrived at the Bowley Road staging area to complete waste manifest paperwork. The north bound shoulder of Lincoln Boulevard was used to locally stage trucks prior to being loaded. As space became available, the lead traffic control flagman contacted the truck coordinator at Bowley Road to send a truck to the site. Two trucks were generally staged on the north bound shoulder of Lincoln Boulevard. After a truck was loaded onsite, flagmen would halt traffic (vehicle, bicycle, and pedestrian) in both directions on Lincoln Boulevard (Photo 5). The loaded truck would depart the site and an empty staged truck on Lincoln Boulevard would enter the site. The departing truck would stage on the south bound shoulder of Lincoln Boulevard to secure tarps to cover its load (Photo 6). The loaded, tarped, and manifested truck would then proceed back to Bowley Road to turn around and exit the Presidio on US Highway 101. Bowley Road was closed, with the exception of San Francisco MUNI bus service, to the public during working hours when truck loading and hauling activities were taking place. The road was open at all other times, including evenings, weekends, and workdays on which no hauling activities occurred. This section of Bowley Road was periodically closed between 9 July 2004 and 18 January 2005. Public access to Baker Beach was maintained throughout the project.

Waste materials for this project were transported to the following facilities for the indicated type of disposition.

- West Contra Costa Landfill, Richmond, California – wood waste recycling;
- Wilabrator Cogeneration Plant, Anderson, California – green waste recycling;
- Marin County FireSafe Projects, Marin County, California – green waste recycling;
- Recovery West, Livermore, California - tire recycling;
- BFI Ox Mountain Sanitary Landfill (Ox Mountain), Half Moon Bay, California - vegetation and soil mix Class III disposal;
- Ox Mountain Landfill – Class III contaminated soil disposal;
- Waste Management Altamont Landfill (Altamont), Livermore, California - Class II contaminated soil disposal; and
- Buttonwillow Landfill (Buttonwillow), Buttonwillow, California - Class I contaminated soil disposal.

A description of the observed waste types and documented volumes in each category disposed at BBDA 3 and BBDA 4 are presented in Section 3.2 and Section 3.3, respectively.

3.1.6 Decontamination

During the excavation and stockpiling of waste at the site, truck decontamination steel plates were placed at BBDA 3. The plates acted as a drive-through decontaminating area. The plates allowed loose dirt and other material to fall off the trucks and tires prior to entering the roadways (Photo 7). No decontamination procedures were required at BBDA 4 because the trucks were loaded while stopped on Battery Chamberlin Road.

3.1.7 Dust Control

Dust control for the project was performed as needed in accordance with general construction practices. In general, fugitive dust conditions were not present at the sites because of the naturally damp coastal environment. However, during dryer, sunnier periods, application of a water spray was used to control dust at BBDAs 3 and 4 (Photo 8).

3.1.8 Construction Erosion Control and Storm Water Pollution Inspections

In accordance with the SWPPP (Treadwell & Rollo, 2004c) and Construction Plans and Specifications, erosion control measures and pollution prevention management practices were implemented during remedial site construction. During excavation and grading activities, temporary engineered physical controls (barrier silt fence and straw wattles) were placed to minimize the potential erosion of bare slopes and prevent offsite migration of sediment (Photo 9). Upon completion of site excavating and grading, all temporary erosion controls were removed, and final erosion control measures installed at BBDA 3 and BBDA 4. The final erosion control measures are discussed in Sections 3.2.6.2 and 3.3.4.2.

As outlined in the SWPPP, potential sources of storm water pollutants include fuels released from site heavy equipment, excavation and grading released sediments, and soil stockpile run-off. No fuel releases from site equipment associated with refueling or active equipment use were observed at either site during the remediation action. In addition to the barrier silt fences, active sweeping of the road surfaces was conducted throughout the remediation action to control potential migration of sediment from the sites via roadway storm water run-off (Photo 10). To prevent migration of sediment from soil stockpiles during inclement weather, earthen berms were constructed and the stockpiles were covered with plastic sheeting.

As required by the SWPPP, following major rain events, conditions at each site were inspected and documented in the Construction Daily Report Forms (Appendix C). Post-construction stormwater inspections have been documented using Stormwater Inspection Forms, as required by the SWPPP. In accordance with the SWPPP, post-construction stormwater inspections occur at a minimum, monthly, or following major rain events. Copies of the completed Storm Water Inspection Forms for BBDA 3 and BBDA 4 are included in Appendix D.

3.2 Baker Beach Disturbed Area 3

The following sections present the observations and details of the activities performed at BBDA 3 during the waste fill removal and site restoration.

3.2.1 BBDA 3 Pre-excavation Activities

Tree and brush removal at BBDA 3 was performed in February 2004 to avoid the bird nesting season, which occurs from 1 March through 15 August. The Trust Forestry Manager inspected the work area and tagged the trees that required removal. A survey to locate nesting birds was performed by Jeffrey Steinman, consulting ornithologist, from 4 to 6 February 2004. Mr. Steinman's *Results of the Baker Beach Disturbed Areas 3 and 4 Bird Survey* report dated February 2004 is included as Appendix E. The conclusions presented in that report indicated that no special status bird species were found to be nesting within the work area. On completion of the bird survey, the Trust contracted a tree service to cut and remove the trees and brush in the work area. The vegetative material was taken off-site for recycling. A total of 780 tons (approximately 522 cy) of vegetative material (trees and brush) was removed.

At BBDA 3, the Plans and Specs called for the phased removal of vegetation to decrease the likelihood of any off-site surface water runoff during the remedial excavation work (Photo 11). At the completion of the tree removal by the Trust, approximately 60 stumps remained in the ground near the toe of the excavation area to enhance slope (waste fill) stability and to serve as an added erosion and surface water runoff control measure. The stumps were removed by the contractor as late as feasible during the remedial excavation work.

As described in the *Slope Stability Evaluation Report for Baker Beach Disturbed Area 3* (Treadwell & Rollo, 2004b), two temporary piezometers, BB3PZ100A and BB3PZ100B, were installed between 29 January and 5 February 2004 (Figure 3). These piezometers were originally for the purpose of monitoring groundwater levels, but groundwater sampling and chemical analysis was subsequently also performed. The development and sampling, as well as laboratory analytical results, are presented in the Slope Stability Evaluation Report. The two piezometers required proper abandonment prior to the beginning of excavation work at BBDA 3. The abandonments were performed on 16 June 2004. However, during the course of the abandonment of BB3PZ100A, the drill bit became entangled in chain-link fencing contained within the fill material. During the removal of the augers to clear the drill bit, the drill rod and well casing both parted at approximately 30 feet bgs. Reconnecting the drill rod was not possible and the abandonment was temporarily suspended.

During the remedial excavation, on 21 September 2004, a limited access drill rig was remobilized to remove the drill rod and well casing to complete the well abandonment at BB3PZ100A. Using the Trust's GPS unit and survey coordinates of the piezometer, the top of the remaining casing was located and exposed (Photo 12). A hollow-stem auger equipped drill

rig over-drilled the casing and removed the remaining rod and casing. The resulting boring was filled with a neat cement grout. All 25 feet of drilling rod and well casing were recovered during this abandonment. Subsequently, the upper 5 feet of the grout column was excavated, removed and the area backfilled with local native sand.

In accordance with the recommendations of the Slope Stability Evaluation Report, survey control points were established along the eastern edge of Lincoln Boulevard, directly upslope of BBDA 3 on 16 June 2004 (Figure 2 and Photo 13). They were re-surveyed for slope stability monitoring approximately every two weeks during active excavation work and approximately every 4 weeks after excavation was completed and while additional site work was being performed. The survey data, specifically the accumulative horizontal and vertical movement, were examined each time to assess whether any movement had taken place. The slope stability monitoring survey data are presented in Table 5. The data indicate that no meaningful movement has occurred. The magnitude of the net movement observed (-0.011 to 0.016 feet) was within the margin of acceptable measurement variability and/or road conditions such as thermal expansion or vibration from passing vehicles during surveying.

3.2.2 BBDA 3 Waste Fill Excavation and Segregation

Between 1 July 2004 and 13 January 2005, a total of 57,595 tons (approximately 38,005 cy) of waste material was removed from BBDA 3. A discussion of the quantity and disposal location for the individual waste streams is presented in Section 3.2.5. The pre-excavation topography and confirmation sampling grid for BBDA 3 is shown on Figure 3. The pre- and post-excavation topographic surveys were used to determine the total volume of waste removed from BBDA 3 (Figure 8).

As required by the DTSC and presented in the Plan and Specs, site excavation was conducted in a phased approach. The material load on the upper slope was to be reduced before the lower toe of the slope was removed. This phased approach was proposed to reduce the potential for slope instabilities during construction by reducing the mass of waste fill in the upper portion of the site while maintaining a plug of soil at the toe of the slope. Thus, between 1 July and 27 July 2004, excavation was limited to the area within the upper slope to reduce the slope surcharge. As construction progressed, excavated material from the slope was continually moved up-slope for stockpiling prior to load out and offsite disposal. On 27 July 2004, with concurrence from DTSC, excavation of the toe or “Phase II Area” of the slope began. On 3 August 2004, DTSC representatives Mr. Robert Boggs and Mr. Ram Ramanujam visited the site to observe site excavation and slope stability conditions.

After the initial grading of the surface and removal of vegetation cover was completed, removal of tree stumps was performed. Using a Caterpillar 330BL excavator, approximately 60 tree stumps (up to approximately 2 feet in diameter) were removed and stockpiled for recycling (Photo 14).

While the excavation of the tree stumps was being performed, excavation and stockpiling of the waste fill was conducted to prepare for off-site disposal. The excavation of fill material at BBDA 3 was performed primarily by using a 330BL excavator and an EL300B long reach excavator (50 feet reach) to excavate and move the material into stockpiles on the upper bench area (Photo 15). Initial samples for waste characterization reported concentrations for lead that required disposal as Class I California Hazardous (CalHaz)Waste. As work progressed, periodic additional waste characterization samples were collected and analyzed (Appendix F, Table F-1). The locations of in-situ waste characterization samples are shown on Figure F-1. Waste samples collected and analyzed after 5 August 2004 indicated that the remaining waste fill did not contain concentrations of lead exceeding the CalHaz waste criteria. The remainder of the waste fill removed from the site was acceptable for Class II and Class III waste disposal. The waste fill was removed until the native dune sand or buttress fill (supporting Battery Crosby Road) was exposed and confirmation samples collected. Excavated waste fill was comprised primarily of fill soil (including chert and serpentinite fragments) and building demolition debris. The demolition debris included broken wooden lumber, concrete and asphalt fragments, chain-link fence and poles, and other small sized construction waste (Photo 16). Several large pieces of building debris (concrete foundation, brick walls, etc.) were also removed during the BBDA 3 excavation activities (Photo 17). Over 200 automobile tires were recovered from the waste fill (Photo 18).

The amount of municipal waste (aluminum cans, glass bottles, plastic and paper waste, etc.) found was limited and observed generally in the shallow fill (less than 3 feet bgs). The limited amount and dispersed distribution of municipal waste made segregation unfeasible. The municipal waste appeared to be of fairly recent origin. A small stack of San Francisco Chronicle newspapers dated 19, 20, and 21 August 1967 were found buried in the waste fill and appeared to be generally representative of the age of the municipal waste. Most cans observed were made of aluminum, and very few steel cans were found. Generally, recovered glass bottles were labeled with current brand names, but with a 1960's vintage design. No other objects of historical or cultural significance were observed during excavation and segregation.

As presented in the RAP, if soil confirmation sample results indicted the presence of contaminant concentrations exceeding the cleanup levels, over-excavation was performed followed by re-sampling in the same area. During construction, over-excavation of 10 areas, including the removal of a portion of the historical Battery Crosby Road, was conducted based on cleanup level exceedances in soil confirmation samples (Figure 4). The over-excavation limits were defined as a point one-half the distance from the exceedance location to the next soil confirmation sample location in each direction. This "box" was excavated to a depth of approximately 1 foot below the depth of the exceedance. Following over-excavation, the original exceedance location (northing and easting) was surveyed, re-established, and then resampled. At two locations (BB3EX128 and BB3EX129), multiple over-excavations were performed to achieve acceptable soil confirmation sample results. The over-excavated material from those locations was disposed of as Class II and Class III waste.

At the request of DTSC, some additional over-excavation of surface material, to a depth of approximately 1 foot in the vicinity of samples BB3EX110[0.5], BB3EX121[0.5], and BB3EX134[0.5] was performed (Figure 4). As agreed in the field walk with DTSC on 21 December 2004, no additional sampling was required after the over-excavation was completed. This excavated material was disposed off-site as Class III soil at Ox Mountain Landfill.

The fill sand, which supports Lincoln Boulevard and was not observed to contain debris, is believed to be free of contaminated material (Treadwell & Rollo, 2004a). Buttress fill sand was placed to support Lincoln Boulevard between 1948 and 1958 (Figure 5). This fill sand was not excavated. Two other areas of known fill were also left in place. These two areas of placed fill are related to the construction of the historical Battery Crosby Road (Figure 5). The fills are distinctly different from each other and likely represent the age of placement.

As shown on Figure 5, a wedge of material, consisting primarily of weathered serpentine and Colma, was left near the northern end of Battery Crosby Road (pre-1958 road fill). This material was placed to bridge a historical ravine to allow the construction of the original road (pre-1958 construction). Based on visual inspection and confirmation sampling results, this material was deemed not to contain any waste material. Because of the lack of waste material, the historical and structural nature of the fill, and the confirmation sampling results, the pre-1958 road fill was left in place.

A second area of fill is located at the head of the new ravine (Figure 5). This material is comprised of mainly chert and was placed as a buttress for the construction of the younger Battery Crosby Road (1958-1973 alignment). Based on visual inspection and confirmation sampling results for the chert roadbed, this material was deemed not to contain any waste material. Because of the lack of waste material, the historical and structurally-supporting nature of the fill, and the confirmation sampling results, the 1958-1973 road fill was left in place.

3.2.3 Historical Battery Crosby Road Documentation

Prior to remediation at the site, the Trust conducted exploratory test pits on the upper bench area of BBDA 3 to attempt to verify and delineate the limits of the historical Battery Crosby Road. Historical aerial photographs had shown that over time, the Battery Crosby Road alignment was modified. As presented in the *Technical Memorandum: Historical Battery Crosby Road and Lead Exploratory Test Pit Excavation Observations and Results* (Treadwell & Rollo, 2004e), the presence of a chert road surface was observed at depths between 1 and 3 feet below the pre-construction ground surface. As a requirement of the NPS 5X project review, the investigation, documentation, and preservation of the historical Battery Crosby Road was to be conducted throughout the remediation construction. The work was coordinated with Mr. Leo Barker, NPS archeologist.

On 30 June 2004, Treadwell & Rollo excavated three test pits (BB3SS100 through BB3SS102) to expose a cross-section of the historical chert roadbed. Samples of the chert roadbed and underlying dune sand were collected and analyzed for site COCs to provide a preliminary waste characterization data (Appendix F, Table F-1). The data indicated detections of PCBs and 4,4'-DDT at concentrations below RAP cleanup levels in two of the three chert roadbed samples analyzed. No exceedances for any of the analyzed compounds in the three samples collected from the underlying dune sand were reported. Based on these data, it appeared that the chert roadbed material was salvageable for reuse or could remain in place. Therefore, subsequent excavation in the vicinity of the historic road alignment was conducted so as to preserve the historic road alignments.

As excavation proceeded, on 18 October 2004, Perf-Ex began to expose the historical Battery Crosby Road. A continuous layer of compacted chert was exposed from Battery Crosby to the truck ramp near Lincoln Boulevard. This alignment appeared to be similar to the 1958-1973 road alignment (Figure 2). The surface was buried up to 4 feet (in the northeast corner) below the pre-construction ground surface. The road alignment was photographed and approximate limits surveyed by the Trust using GPS. A site meeting was conducted on 27 October 2004 with the Trust, NPS, and Treadwell & Rollo. Mr. Barker was shown the exposed historical road surface and alignment. He requested that the roadbed be trenched to attempt to identify the approximate limits of the roadway.

On 3 November 2004, Treadwell & Rollo supervised and logged two trenches to identify the limits of the chert roadbed (Figure 10). A backhoe from the Trust was used to excavate two trenches bisecting the roadway (Photo 19). A trench oriented north to south exposed a road bed comprised of varying thicknesses of red-brown chert overlying, golden-yellow weathered serpentine on dune sand. The apparent width of the roadway was approximately 20 feet. The second trench, oriented east to west, exposed red-brown chert on dune sand. The thickness of the chert road bed varied from approximately 3 feet thick on the eastern end, thinning to a veneer to the west. The apparent width of the roadway was approximately 50 feet. The differences observed in the roadbed construction are likely because the trenches expose two separate roadways. The north to south trench exposes the original, pre-1958 road alignment, while the east to west trench exposes the newer 1958-1973 roadway alignment (Figure 2).

Additionally, on 3 November 2004, while excavating fill material, an apparent metal retaining wall, a support for the historical Battery Crosby Road, was exposed (Figure 10). The retaining wall is constructed of vertical placed, corrugated metal sheets. The sheets are tie-backed with wire ropes and "deadman" stakes. The southern side of the retaining wall is buttressed with a large wedge of weathered serpentine gravel (Figure 10 and Photo 20). The total depth of the metal sheets and buttress gravel wedge was not identified. However, a test pit excavated adjacent to the retaining wall to a depth of approximately 9 feet was terminated in weathered serpentine gravel without exposing the bottom end of the corrugated metal sheets. The total length of wall exposed was approximately 25 feet. The exposed end points of the retaining wall

and road bed trenches were surveyed by the Trust using a global positioning system (GPS) device.

On 4 November 2004, Mr. Barker visited the site. The trenches and retaining wall excavation from the previous day was left open for his observation. Mr. Barker observed and photographed the excavations. Upon completion, Mr. Barker suggested that the retaining wall excavation be filled in and allowed to be left in place and the two trenches across the road bed backfilled.

As excavation continued, the eastern portion of the Battery Crosby Road was narrowed to 20 feet wide to match the older, pre-1958 dimensions. The chert roadbed was excavated exposing dune sand. The excavated chert was stockpiled separately for potential reuse for resurfacing of the Battery Crosby Road at the completion of construction. On 17 November 2004, a waste characterization sample of the stockpiled chert was collected. The results of the analyses indicated no exceedances for the site COCs.

During the soil confirmation sampling to document clean closure, a number of soil confirmation samples were collected from or adjacent to the chert roadway. Analytical results from soil confirmation samples BB3EX146 through BB3EX148 detected exceedances for one or more COCs. Based on these results, a portion of the historical Battery Crosby roadway was excavated and removed. Once overexcavation was completed, the area was re-sampled. The results from subsequent sampling indicated that the contaminants had been removed. The removed section of the historical Battery Crosby Road will be reconstructed.

3.2.4 BBDA 3 Chemical Analysis and Results

Soil samples were collected and analyzed to characterize the waste fill materials for disposal profiling and confirmation sampling to ensure that the material left in place meets the applicable cleanup levels intended for the planned land uses and protection of ecological receptors. The following section presents the sampling and analyses performed at BBDA 3. The locations of the soil confirmation samples collected at former BBDA 3 are presented on Figure 4.

3.2.4.1 Waste Characterization Sampling and Results

As specified in the construction contract, waste characterization was conducted by Perf-Ex to identify the types of waste material present and obtain waste profiles for off-site disposal or recycling at appropriate facilities. Waste characterization sampling protocols are not specified in the QAPP. However, the waste characterization sampling and analysis were conducted using protocols required by the individual waste disposal facilities. Generally, stockpiled material was discretely sampled and then composited prior to analysis. Additionally, to assist with the waste profiling of materials generated during over-excavation activities, the Trust provided Perf-Ex with analytical results from the soil confirmation samples that exceeded cleanup levels prior to over-excavation. Perf-Ex submitted the soil confirmation sample data as waste characterization

data for these materials. Table F-1 presents the analytical results of samples used for waste characterization collected from BBDA 3. The locations of in-situ waste characterization samples are shown on Figure F-1. Copies of the laboratory reports for the waste characterization sample results are included in Appendix F.

Prior to the implementation of the BBDA 3 RAP activities, the Trust performed initial waste characterization activities to evaluate the potential presence of hazardous levels of lead in the fill material. As presented in Treadwell & Rollo's *Technical Memorandum: Historical Battery Crosby Road and Lead Exploratory Test Pit Excavation Observations and Results* dated March 2004 (Treadwell & Rollo, 2004e), analytical results from soil test pit samples indicated the presence of soluble lead exceeding CalHaz waste criteria for two of six test pits. These exceedances were not adjacent to each other.

Three hazardous waste criteria have been established by State and Federal regulators with respect to metals. The State has two criteria based on total and soluble metal concentrations: the total threshold limit concentrations (TTLC) based on total metals analysis, and the soluble threshold limit concentration (STLC) based on the California Waste Extraction Test (WET). The WET test involves a ten times dilution of the sample extract. Soil with concentrations meeting or exceeding these values is considered a State hazardous waste.

The Federal hazardous waste criteria are based on the soluble metal levels determined by the Toxicity Characteristic Leaching Procedure (TCLP) test method. Soil with metal concentrations exceeding the Federal criteria is considered a Federal hazardous waste and must be treated to reduce soluble metal levels either on-site prior to transport or at a Class I hazardous waste landfill prior to disposal.

Further soluble metals analyses using the WET and TCLP indicated that soluble lead concentrations classified the majority of the fill as Class I CalHaz waste. No reported concentrations of lead indicated the waste would meet or exceed Federal Resource Conservation and Recovery Act (RCRA) hazardous waste criteria.

On 14 June 2004, Perf-Ex performed their initial waste characterization sampling to profile the fill materials encountered at BBDA 3. An excavator was used to excavate "potholes" through the fill material. A total of nine potholes were excavated at BBDA 3. The pothole locations were randomly selected to obtain sufficiently representative samples for total and soluble lead chemical analyses. The soil samples were collected, composited into seven samples, and analyzed. These analytical results obtained by Perf-Ex were used to augment the initial waste characterization data collected by the Trust (Treadwell & Rollo, 2004e).

The Perf-Ex analytical results for total lead indicated elevated concentrations (>50 milligrams per kilogram (mg/kg)) in each of the seven samples. Subsequent WET analysis for lead indicated that four of the seven samples contained concentration for soluble lead that exceeded the Class I CalHaz (non-RCRA) Waste limits. Consistent with the earlier Trust waste characterization

results, the distribution of the exceedances appeared to be random across the site and did not represent a pattern.

Because of the random distribution of the exceedance for CalHaz limits throughout the site, the waste material stockpiles were sampled and analyzed to determine whether waste concentrations warranted Class I CalHaz disposal. Samples of the soil stockpiled onsite were periodically collected and analyzed by Perf-Ex. This periodic analysis was performed as a verification check or if a visual change in the excavated material was observed to determine if the soluble lead levels continued to exceed the concentrations acceptable at Class II disposal facilities (Appendix F, Table F-1). In total, 11 stockpile sampling events were performed between June and October 2004. Waste characterization samples from the stockpiled material indicate that the fill remaining onsite as of September 2004 did not exceed CalHaz waste criteria.

Beginning in September 2004, excavated waste material was accepted at either Class II or Class III disposal facilities or recycled. Samples were submitted for chemical analyses in accordance with the waste profiling requirements of each individual waste disposal facility. A breakdown of the disposal facilities and quantity of material is presented in Section 3.2.5.

3.2.4.2 Soil Confirmation Sampling

Soil confirmation samples were collected at BBDA 3 between 30 July and 23 November 2004 (Photo 21). As indicated on Figure 4, excavation "bottom" samples were collected on a pre-marked 75-foot by 75-foot sampling grid. Excavation "perimeter" samples were collected approximately every 75 feet along the limits of the excavation. Along the northwestern boundary of the excavation, a single "combined" sample served as both a "bottom" and "perimeter" sample (BB3EX103[0.5], BB3EX107[0.5], and BB3EX121[0.5]). Also indicated on Figure 4 are sample locations that were removed by over-excavation, based on cleanup level exceedances identified by laboratory analytical results. Additionally, confirmation samples were collected north of the western limits of the excavation to verify that soil in the area was not impacted.

A series of three sites walks were conducted with representatives from the DTSC, Trust, NPS and Treadwell & Rollo. On 27 October 2004, a site walk was conducted to discuss the confirmation sample locations and analytical results obtained to date, as well as proposed groundwater and surface water monitoring locations. Based on discussions during that site walk and on the fact that grid samples were located only along the edges of the ravine in this area, additional soil confirmation samples (BB3EX116[0.5], BB3EX130[0.5], BB3EX138[0.5] and BB3EX139[0.5]) were collected in November 2004 along the approximate centerline of the ravine created by the excavation of the waste fill material. A follow-up site walk was conducted on 21 December 2004 and a final site walk including a senior representative of DTSC was conducted on 5 January 2005 to discuss all confirmation sample locations and data obtained, and to observe the locations of the recently installed groundwater monitoring wells and fixed water

monitoring points. No additional soil confirmation sampling was required as a result of either of these two site walks.

3.2.4.3 Soil Confirmation Sample Results

The analytical results and effective soil cleanup levels for BBDA 3 soil confirmation samples are presented in Tables 6 through 12. Results for samples collected from beach/dune sand, Colma soils, or serpentinite are compared to RAP cleanup levels presented in Table 1A. Results for chert samples, which were all collected from the historical Battery Crosby Road alignment, are compared to cleanup levels derived from the Cleanup Levels Document (EKI, 2002). Copies of the laboratory reports for soil confirmation samples are included in Appendix A. The data validation report is included in Appendix B.

COCs

As presented in Section 2.2, COCs in soil at BBDA 3 included:

- cadmium, cobalt, lead, and zinc;
- dieldrin, chlordane (including alpha-chlordane, gamma-chlordane, and chlordane), and 4,4'-DDT; and
- PCB Aroclor-1254.

Metals results are summarized in Table 6. Cobalt and zinc were detected in all soil confirmation samples; lead was detected in all but one sample; and cadmium was detected in 26 out of a total of 66 samples. Cadmium concentrations ranged between less than 0.15 mg/kg to 1.0 mg/kg, all below applicable cleanup levels. At sample location BB3EX122[0.5], cobalt was detected at 61 mg/kg, exceeding the cleanup level for Colma soils of 21 mg/kg; this area was subsequently over-excavated and re-sampled (Photo 22). For all other samples, cobalt concentrations were below applicable cleanup levels and ranged between 3.5 mg/kg to 25 mg/kg. Lead concentrations ranged between 0.14 mg/kg to 83 mg/kg, well below the applicable cleanup level of 160 mg/kg for all lithologies. At sample locations BB3EX100[0.5], BB3EX116[0.5], and BB3EX120[0.5], zinc was detected at concentrations of 72, 87, and 71 mg/kg, respectively, exceeding the cleanup levels for beach/dune sand of 66 mg/kg. These three areas were subsequently over-excavated (Photo 22) and re-sampled. For all other samples, zinc concentrations were below applicable cleanup levels and ranged between 11 mg/kg to 49 mg/kg.

Pesticide results are presented in Table 7. Dieldrin was not detected in any samples at concentrations exceeding the cleanup level of 30 micrograms per kilogram (µg/kg). 4,4'-DDT was detected above the cleanup level of 8.2 µg/kg in samples BB3EX115[0.5], BB3EX120[0.5], BB3EX145[0.5], BB3EX146[0.5], and BB3EX148[0.5]. All six of these areas were subsequently over-excavated and re-sampled. All other samples had 4,4'-DDT concentrations below detectable levels or below the cleanup level. Neither alpha-chlordane nor gamma-

chlordane was present above cleanup levels in any samples. For those samples that contained detectable amounts of either of the two chlordane isomers, the concentrations were added together and compared to the cleanup level of 9 μg/kg. The highest combined chlordane isomer concentration was 6.9 μg/kg and the highest combined reporting limit was less than 7.4 μg/kg, both below the cleanup level of 9 μg/kg.

Exceedances of PCBs (Arochlor-1248 and Arochlor-1254) were found in samples BB3EX100[0.5], BB3EX115[0.5], BB3EX120[0.5] and its duplicate DUP083004A, BB3EX145[0.5], BB3EX147[0.5], and BB3EX148[0.5], ranging in concentrations from 36 to 180 μg/kg, above the applicable cleanup level of 33 μg/kg. These areas were all subsequently over-excavated and re-sampled. PCB concentrations in all other samples and for the re-sampled areas were below detectable levels (Table 8).

Other Compounds

Among the non-COC pesticides, the pesticide gamma-BHC was detected at concentrations exceeding the cleanup level of 10 μg/kg in samples BB3EX145[0.5], BB3EX145[1.0], and BB3EX148[0.5]. All three areas were subsequently over-excavated and re-sampled, and gamma-BHC was not detected in any other samples (Table 7). Several samples had reporting limits elevated above applicable cleanup levels for 4,4'-DDT, aldrin, endrin, endrin ketone, and/or the combined isomers of alpha- and gamma-chlordane. Samples BB3EX100[0.5], BB3EX116[0.5], and BB3EX118[0.5] were over-excavated and re-sampled, and no further exceedances were found. For sample DUP110504[0.5], the elevated reporting limits of 7.2 μg/kg for endrin and endrin ketone were found only in the duplicate and not in the primary sample (BB3EX143[0.5]). Endrin and endrine ketone were not present above the 3.6 μg/kg detection limit in the primary sample and no OCPs were detected in either sample. Therefore, this sampling location is considered to meet cleanup requirements.

Of the non-COC metals, residual concentrations for nickel, selenium, and vanadium exceeded cleanup levels in a total of five locations (Table 6). The rationale for leaving these exceedances in place is presented below and summarized in Table 9.

BB3EX128[0.5] contains selenium at a concentration of 0.7 mg/kg, which exceeds the cleanup level for Colma soils (0.5 mg/kg), but is below the cleanup level for beach/dune sand (0.75 mg/kg). Although the sample was logged as Colma, it is located near the Colma and beach/dune sand contact and actually contains a mixture of Colma soil and beach/dune sand. This explains the slightly elevated selenium concentration when compared to the Colma cleanup levels. The result meets the beach/dune sand cleanup level and is considered acceptable for this sample.

The evaluation of all other metals exceedances involved an assessment of overall risk posed by the residual concentrations, which was done by calculating the 95% upper confidence limit of the mean (95% UCL) of the residual soil confirmation results. The 95% UCL of a mean is defined as a value that, when calculated repeatedly for randomly drawn subset of data, equals or exceeds

the true mean 95 percent of the time. U.S. EPA's *Risk Assessment Guidance for Superfund* (EPA,1989) indicates that the exposure concentration of a given chemical for evaluating exposure and associated risks under an assumed Reasonable Maximum Exposure (RME) will be based on the 95% UCL. The RME represents the area-wide concentration to which a receptor would be exposed. The use of the 95% UCL represents the fact that receptors would not be exposed to isolated locations where there are cleanup level exceedances, but would be exposed to area-wide concentrations, and the 95% UCL represents an upperbound estimate of the average area-wide residual exposure concentration. The 95% UCL calculations are described in Appendix G and presented in Table G-1.

- BB3EX128[0.5] has a nickel concentration of 150 mg/kg, which exceeds the cleanup level for Colma soils of 110 mg/kg. To evaluate the level of residual risk posed by this result, the 95% UCL of the mean was calculated for nickel using the analytical results for all sampling locations that had not been removed (over-excavated). The procedures used in the calculations are described in detail in Appendix G. The data distribution for nickel is shown on Figure G-1A and the calculations are presented in Table G-1. As indicated in Table G-1, the 95% UCL of the mean for nickel equals 32 mg/kg, which is below the RAP cleanup levels of 70, 110, and 4,500 mg/kg for native beach/dune sand, Colma, and serpentinite, respectively. Therefore, the remaining levels of nickel at BBDA 3 are not considered to pose an unacceptable risk to human health or the environment.

- BB3EX141[2.5] and BB3EX141[5.5] contain vanadium at 91 mg/kg and 100 mg/kg, respectively. Both samples were collected from pre-1958 road fill underlying Battery Crosby Road. Based on visual inspection in the field, the road fill consists of a mixture of beach/dune sand, Colma soil, and serpentinite, resulting in elevated vanadium concentrations relative to the 74 mg/kg cleanup level for serpentinite. However, the 91 mg/kg result for BB3EX141[2.5] meets the 92 mg/kg cleanup level for beach/dune sand. Therefore, the result is considered acceptable for this sample. To evaluate the level of residual risk posed by the 100 mg/kg result for BB3EX141[5.5], the 95% UCL of the mean was calculated for vanadium using the analytical results for all sampling locations that had not been removed (over-excavated). The procedures used in the calculations are described in detail in Appendix G. The data distribution for vanadium is shown on Figure G-1C and the calculations are presented in Table G-1. As indicated in Table G-1, the 95% UCL of the mean for vanadium equals 45 mg/kg, which is below the RAP cleanup levels of 92, 90, and 74 mg/kg for native beach/dune sand, Colma, and serpentinite, respectively. Therefore, the remaining levels of vanadium at BBDA 3 are not considered to pose an unacceptable risk to human health or the environment.

- BB3EX151[0.5] and BB3EX152[0.5] contain selenium at 0.72 and 1.3 mg/kg, respectively. Both samples were collected from the non-native chert road surface material on Battery Crosby Road. The detected concentrations exceed the cleanup level for chert of 0.5 mg/kg. To evaluate the level of residual risk posed by these results, the 95% UCL of the mean was calculated for selenium. The procedures used in the calculations are described in detail in Appendix G. The data distribution for selenium is shown on Figure G-1B, and the calculations are presented in Table G-1. As indicated in Table G-1, the 95% UCL of the mean for selenium equals 0.38 mg/kg, which is below the chert cleanup level of 0.5 mg/kg. Therefore, the remaining levels of selenium at BBDA 3 are not considered to pose an unacceptable risk to human health or the environment.

Therefore, the remaining levels of the non-COC metals (nickel, selenium, and vanadium) are not considered to pose an unacceptable risk to human health or the environment. Based on the rationale presented above and in Table 9, BBDA 3 is suitable for unrestricted land use.

In accordance with the RAP, 10 percent of the soil confirmation samples were analyzed for an expanded suite of chemical analyses, which included TPHd, TPHfo, VOCs, SVOCs, and chlorinated herbicides.

Detections of TPHd ranged between <1 mg/kg and 36 mg/kg, well below the cleanup level of 700 mg/kg (Table 10). Detections of TPHfo ranged between <5 mg/kg and 87 mg/kg, also well below the cleanup level of 980 mg/kg.

Sample BB3EX116[0.5] had the following concentrations of SVOCs (Table 11): benzo(a)anthracene at 580 µg/kg, benzo(a)pyrene at 620 µg/kg, benzo(b)fluoranthene at 450 µg/kg, benzo(k)fluoranthene at 690 µg/kg, and indeno(1,2,3-c,d)pyrene at 300 µg/kg, which exceeded applicable cleanup levels of 270, 27, 270, 270, and 270 µg/kg, respectively. This area was subsequently over-excavated and re-sampled. For all other samples, the standard laboratory reporting limits were above applicable cleanup levels for 1,4-dichlorobenzene and benzo(a)pyrene. No SVOCs were detected in the remaining BBDA 3 samples, and the instances of elevated reporting limits do not pose a concern. SVOCs are not COCs for BBDA 3 and it appears that SVOCs are not present at levels that may pose an unacceptable risk to human health or the environment.

No VOCs were present at detectable levels, and all laboratory reporting limits were below applicable cleanup levels (Table 11).

No chlorinated herbicides were detected in any of the seven samples submitted (Table 12). One sample (BB3EX116[0.5]) was over-excavated due to exceedances of other compounds. The remaining six samples had slightly elevated reporting limits for 2,4-D (<0.029 mg/kg versus cleanup level of 0.025 mg/kg) and MCPP (2-(2-Methyl-4-chlorophenoxy) propionic acid)

(<5.3 mg/kg versus cleanup level of 5 mg/kg), and two samples also had slightly elevated reporting limits of <0.011 mg/kg for dicamba (versus cleanup level of 0.010 mg/kg). The absence of detectable pesticides in all samples indicates that they were generally free of chlorinated herbicides. Therefore, these minor elevations of reporting limits are unlikely to mask the presence of herbicides exceeding cleanup levels. It appears that chlorinated herbicides are not present in site soils at levels that may present an unacceptable risk to human health or the environment.

QA/QC Field Samples

In accordance with the QAPP, duplicate soil samples were collected and analyzed at a rate of 10 percent of the primary samples. Laboratory prepared trip blank samples were included in sample shipments containing samples for VOC analysis. The analytical results for the seven soil confirmation sample duplicate samples are included in Tables 6 through 12. The analytical results for the trip samples are presented in Table 13. No VOCs were detected in the trip blanks.

All confirmation samples at BBDA 3 were collected by pushing the sampling tubes into the soil material, thus no sampling equipment was used. Therefore, no equipment rinsate blank samples were required.

3.2.4.4 BBDA 3 Soil Confirmation Sample Data Validation

VOCs

Reporting Limits: Reporting limits were somewhat elevated for acetone and methylene chloride, as well as bromoform, bromomethane, chloroethane, and chloromethane. For all other samples, the laboratory reporting limits met the project required reporting limits.

SVOCs

Reporting Limits: Reporting limits were somewhat elevated for 2-nitrophenol and acenaphthene. For all other samples, the laboratory reporting limits met the project required reporting limits.

MS/MSD: The detected result for pyrene in sample BB3EX116[0.5] was qualified as estimated with a low bias (J-) due to percent recovery failure.

TPH Diesel/Fuel Oil Range

The laboratory reporting limit met the project-required reporting limit, and qualification was not required for any results.

Sample BB3EX139[0.5] did not receive silica gel cleanup procedure. Since the sample was non-detect for TPH-diesel and fuel oil, the anomaly would not affect the usability of the data. All other samples were silica gel cleaned.

Organochlorine Pesticides

Reporting Limits: The results for all compounds in sample BB3EX100[0.5] were reported as non-detect at a five-fold dilution due to the nature of the sample matrix. The results for all compounds in samples BB3EX116[0.5] and DUP110504A were reported as non-detect at a two-fold dilution due to the nature of the sample matrix. For all other samples, the laboratory reporting limits met the project required reporting limits.

Initial Calibration: Sample BB3EX111[0.5] was non-detect for beta-BHC, delta-BHC, and endosulfan sulfate, and the results were qualified as estimated (UJ). Samples BB3EX112[0.5] through BB3EX115[0.5] were non-detect for endosulfan sulfate and endrin ketone and were qualified as estimated (UJ).

Continuing Calibration: Samples BB3EX101[0.5] through BB3EX105[0.5] were non-detect for delta-BHC and 4-4'-DDT and were qualified as estimated (UJ). Samples BB3EX107[0.5], BB3EX109[0.5], and BB3EX110[0.5] were non-detect for endrin and were qualified as estimated (UJ). Sample BB3EX111[0.5] was non-detect for 4,4'-DDT and methoxychlor and were qualified as estimated (UJ). Samples BB3EX120[0.5] and DUP083004A were non-detect for 4,4'-DDT and were qualified as estimated with a low bias (J-). Sample BB3EX130[0.5] was non-detect for endrin ketone and was qualified as estimated (UJ). Sample BB3EX139[0.5] was non-detect for 4,4'-DDT and was qualified as estimated (UJ).

Surrogate Recoveries: Samples BB3EX124[0.5], BB3EX137[0.5], BB3EX138[0.5], BB3EX141[5.5], and BB3EX146[1.0] were non-detect for alpha-BHC, beta-BHC, delta-BHC, gamma-BHC, aldrin, heptachlor, heptachlor epoxide and endosulfan I were qualified as estimated (UJ).

Polychlorinated Biphenyls

Reporting Limits: The laboratory reporting limits met the project-required reporting limit.

MS/MSD: Sample BB3EX118[0.5] was non-detect for Arochlors-1016 and -1260 and was qualified as estimated (UJ).

Surrogate Recoveries: Samples BB3EX118[0.5] and BB3EX130[0.5] were non-detect for PCB Arochlors-1248, -1254, and -1260 and were qualified as estimated (UJ). Sample BB3EX118[0.5] was also non-detect for PCB Arochlors-1016, -1221, -1232, and -1242 and was qualified as estimated (UJ).

Chlorinated Herbicides

The laboratory reporting limits met the project-required reporting limits, and qualification was not required for any results.

Metals

Reporting Limits: The laboratory reporting limits met the project-required reporting limits.

Initial and Continuing Calibrations: Sample BB3EX153[0.5] had a value of selenium between the reporting limit and two times the reporting limit and was qualified as estimated with a high bias (J+).

MS/MSD: The detected results for antimony and vanadium in samples BB3EX111[0.5] through BB3EX115[0.5] were qualified as estimated with a low bias (J-/UJ). The detected result for antimony and nickel in sample BB3EX116[0.5] was qualified as estimated with a low bias (J-/UJ). The detected results for antimony, chromium, and vanadium in sample BB3EX118[0.5] were qualified as estimated with a low bias (J-/UJ). Samples BB3EX117[0.5], BB3EX120[0.5], BB3EX121[0.5], and DUP083004A were non-detect for antimony and were qualified as estimated (UJ). The detected results for barium and cobalt in samples BB3EX128[0.5] through BB3EX136[0.5] and DUP100104A were qualified as estimated with a high bias (J+), and the non-detect results for antimony in the same group of samples were qualified as estimated (UJ). The detected results for barium in samples BB3EX151[0.5] through BB3EX154[0.5] and DUP112204A were qualified as estimated with a low bias (J-), and the detected results for antimony, arsenic, beryllium, chromium, cobalt, lead, molybdenum, nickel, selenium, silver, thallium, vanadium, and zinc in the same group of samples were qualified as estimated with a low bias (J-/UJ) for percent recovery failure.

ICP Serial Dilution: The detected results for copper in samples BB3EX111[0.5] through BB3EX115[0.5] and BB3EX122[0.5] through BB3EX127[0.5] were qualified as estimated (J). The detected results for beryllium in samples BB3EX128[0.5] through BB3EX136 and DUP1000104A were qualified as estimated (J).

Field Duplicate Samples

Seven samples were collected in duplicate at the BBDA 3 site. The calculated RPD in the result for zinc was above project criteria in one pair of samples and for lead in two pairs of samples. The imprecision in the results in the field duplicate pairs may be due to sample matrix, sample non-homogeneity, sampling or laboratory technique, or method defects. Since the effect on the quality of data is not known, no data were qualified.

3.2.5 BBDA 3 Waste Stream Disposal

The total quantity of waste removed from BBDA 3 is 57,595 tons (Table 14). The materials were either recycled or disposed at appropriate off-site facilities. The following sections present the quantities and final disposition for each waste stream. The reported tonnages for all excavated waste are compiled from the waste manifests and weight tickets received from each waste facility, which are included in Appendix H. The volumes are estimated based upon an

overall conversion factor of 1.495 tons per bank cubic yard, which was calculated by dividing the total tonnage excavated prior to the post-construction survey (56,049 tons) by the total bank cubic yards excavated (37,493 cy), as documented by the post-construction survey. Additional details regarding the calculation of the conversion factor are presented in Table 14. The conversion factor represents an average unit weight (tons per bank cubic yard) for all excavated material. The actual unit weights cannot be determined, as individual waste stream volumes could not be measured in-place, prior to excavation.

3.2.5.1 Pre-excavation Tree and Brush Removal

Prior to the beginning of waste excavation activities, the Trust contracted with a tree removal service to clear tress and brush from BBDA 3. Approximately 780 tons (approximately 522 cy) of green waste were chipped and recycled off-site.

3.2.5.2 Recycled Green Waste (Logs and Tree Stumps)

Approximately 88 tons (approximately 59 cy) of green waste, primarily logs and tree stumps, were excavated and transported to West Contra Costa Landfill for recycling.

3.2.5.3 Recycled Material

The recovered auto tires (4 tons, or 3 cy) were recycled at Recovery West. A small quantity of metal pipe was recovered during the removal of waste fill at BBDA 3. The quantity of metal was not a sufficient quantity to recycle and was disposed with the Class II waste soil.

3.2.5.4 Contaminated Soil, Class III Disposal

Approximately 1,891 tons (approximately 1,265 cy) of Class III soil were removed and disposed at Ox Mountain Landfill.

3.2.5.4 Contaminated Soil, Class II Disposal

Approximately 12,062 tons (approximately 8,068 cy) of Class II soil were removed and disposed at Altamont Landfill.

3.2.5.5 Contaminated Soil, Class I Disposal

Approximately 42,770 tons (approximately 28,610 cy) of CalHaz waste was disposed at the Class I facility at Buttonwillow.

3.2.6 BBDA 3 Surface Restoration

Following a 5 January 2005 onsite meeting with representatives of the DTSC, Trust, and NPS, concurrence that the final results from the soil confirmation sampling documented clean closure was received and site restoration activities began.

3.2.6.1 Final Grading

After completion of the confirmation sampling program, the site was re-graded in several areas, mostly in the immediate vicinity of Battery Crosby Road, to facilitate proper drainage, mitigate surface erosion during storm events, and achieve an acceptable appearance (Photo 23). Post-construction topography after re-grading is shown on Figures 5, 8, and 10.

3.2.6.2 Erosion Control

As presented in the Plans and Specs, the final finished surface of the site required certain erosion control features to stabilize it prior to the establishment of vegetation. Following the contouring of the slope, the temporary erosion control devices were installed (Photo 23). These devices included straw wattle placed on topographic contours across the upper, northern slope and silt fences and straw wattles placed across the centerline of the ravine along 10-foot contour intervals at the upper edge of the slope (Figure 5).

The erosion control materials were installed in accordance with the Plans and Specs. The straw wattles were placed along pre-determined topographic contours. The positions of the straw wattles were fixed in the field using a hand level to maintain the line of topographic contour. The straw wattles were then installed and staked into place.

The installation of the sand bag check dams were added as a modification to the original final erosion control measures presented in the Plans and Specs (Photo 24). Because the dune sand has little cohesion, the constant flow of water from the seeps caused locally severe erosion including incising and movement of the sand. The sand bag check dams positioned at regular intervals slowed the flow of water and facilitated deposition and retention of mobilized sand. Sand bag check dams were constructed using burlap sand bags filled with locally derived sand, and the areas between the check dams were covered with an erosion control mat.

This modification was required due to the presence of groundwater seeps exposed during excavation. The seeps originally were observed as localized wet areas located mid-slope and near the lower portion of the slope on the northern flank of the ravine. These seeps appeared as damp to wet sand approximately 2 feet thick. The flow of the seeps during construction was initially not measurable. As the construction proceeded, unusually heavy winter storms delivered multiple inches of measurable precipitation, and seeps were observed along the entire portion of the northern flank of the ravine from mid-slope to the toe. Currently, the main source of the surface water seep is a localized area near fixed water monitoring point BB3SW102 (Figure 5).

The flow rate of this main seep area appears to be directly related to rainfall. During high seep flow periods, which generally occur in the days immediately following heavy rainfall, total flow of up to 5 to 7 gallons per minute have been measured. Because of this high flow, the final erosion control measures have been modified to include a diversion pipe to contain and direct the main seep flow to the beach. The flow is being temporarily diverted via a discharge pipe to a vegetated area in the sand dunes immediately below the site in an effort to protect the exposed on-site dune sand slope from severe erosion (Photos 25 and 26).

On 14 February 2005, a final site inspection and approval of the erosion control installation was conducted by the Project Engineer and CQA Officer, Mr. Wendell Minshew.

3.2.6.4 Re-vegetation

To assist with erosion control measures, NPS established a willow mattress after remedial excavation had begun near the toe of the slope, and willow shoots were planted by NPS in the area beginning 27 August 2004 (Photo 27). As evidenced during heavy rainfall events in the late fall and early winter of 2004, these willow shoots tend to become partially buried by wind- and water-borne sand and will require periodic maintenance until they become established. Once established, the willow mattress will aid in stabilizing the toe of the slope.

Full native vegetation restoration planting at BBDA 3 is being performed by NPS. These activities are ongoing and will continue periodically as needed and at the discretion of NPS..

3.2.6.5 Battery Crosby Road Realignment

[As of the date of publication of this draft, the final design of the Battery Crosby Road realignment was still pending. All activities associated with the reconstruction of the road, including a final site survey, will be documented in a future addendum to this report.]

3.2.6.6 Post-Construction Erosion Control Monitoring

The Trust will continue storm water inspections and prepare annual compliance reports in accordance with the Work Plan, the SWPPP, and the SWRCB general permit.

3.3 Baker Beach Disturbed Area 4

The following sections present the observations and details of the remedial activities performed at BBDA 4 during the removal of impacted fill and site restoration. The BBDA 4 pre-excavation topography is shown on Figure 6. No other pre-excavation activities, such as tree removal, were required at this site.

3.3.1 BBDA 4 Excavation and Segregation

Between 5 and 7 October 2004, a total of approximately 600 tons (452 bank cubic yards, as measured by surveying) of waste material were removed from the site. A discussion of the quantity and disposal location for the individual waste streams is presented in Section 3.3.3. The pre- and post-excavation topographic surveys were used to determine the volume of waste removed from BBDA 4 (Figure 9).

As presented in the RAP and Plans and Specs, excavation at BBDA 4 was conducted in one mobilization. Public access to Battery Chamberlin Road and the Lincoln Boulevard footpath was maintained during all site construction activities.

On 5 October 2004, the excavator was mobilized to BBDA 4 and off-site removal of green wastes began. As presented in Section 3.3.2.1, waste characterizations samples identified the impacted fill as Class II and Class III waste material. These materials were excavated and temporarily placed in two separate stockpiles at BBDA 3. The fill was removed until the native or non-impacted fill material was exposed and confirmation samples collected. The native material at the site consisted of beach/dune sand.

The excavation of fill material at BBDA 4 (Photo 28) was performed using the EL300B long reach excavator. The excavator loaded the material into 10-wheel dump trucks which transferred the material to stockpiles at BBDA 3 (Photo 29). Observations of the fill exposed during the excavation indicated that it was comprised primarily of uniformly sized fragments of concrete with random fragments of asphalt debris. The concrete debris was roughly 1 to 2 feet square (Photo 30). The vegetation/soil mixture indicated in Table 14 was comprised of scraped surface ice plant and dirt. It was not cost effective to segregate the green waste. The small quantity of green waste was added to the existing soil stockpile at BBDA 3. No municipal waste (aluminum cans, glass bottles, plastic and paper waste, etc.) was observed at BBDA 4.

No objects of historical or cultural significance were observed or collected during the course of excavation and segregation activities.

3.3.2 BBDA 4 Chemical Analysis and Results

3.3.2.1 Waste Characterization Sampling and Results

Waste characterization sampling was performed by Perf-Ex to profile the non-native waste and fill materials encountered at BBDA 4. On 20 July 2004, four hand-dug “potholes” were excavated in the fill material to collect samples for waste profiling. The pothole locations were randomly selected to try to obtain sufficiently representative samples for chemical analyses. Table F-1 presents the analytical results for waste characterization of samples collected from BBDA 4. Copies of the laboratory reports for the waste characterization sample results are included in Appendix F.

The waste profiling samples were submitted for chemical analyses as required by the individual waste disposal facilities. The waste characterization results for the samples indicated concentrations acceptable for Class II and Class III disposal facilities.

3.3.2.2 Soil Confirmation Sampling

Soil confirmation samples were collected on 7 October 2004. At BBDA 4, confirmation samples were to be collected on a 50-foot by 50-foot sampling grid in accordance with the RAP. However, due to the limited areal extent of the actual excavation, samples were collected at a greater density than required by the RAP. As shown on Figure 7, "bottom" samples were collected every 20 feet across the width of the center of the excavation and "perimeter" samples were collected approximately every 50 feet along the edge of the excavation.

On 20 October 2004, a meeting and site walk were conducted with representatives from the DTSC, Trust, NPS and Treadwell & Rollo to discuss confirmation sample locations and analytical data collected to date. No further action was required as a result of the final site walk.

3.3.2.3 Soil Confirmation Sample Results

The analytical results for BBDA 4 soil confirmation samples and effective soil cleanup levels are presented in Tables 15 through 19. Copies of the laboratory reports for soil confirmation sample results are included in Appendix A. The data validation report is included in Appendix B.

COCs

As presented in Section 2.2, lead, zinc, 4,4'-DDT and chlordane (including chlordane and gamma-chlordane) are the COCs for soil identified in the RAP for BBDA 4.

Detected concentrations for lead reported in the confirmation samples ranged between 1.7 mg/kg to 31 mg/kg, well below the cleanup level of 160 mg/kg (Table 15). Similarly, detected concentrations for zinc ranged between 16 and 35 mg/kg, well below the cleanup level of 66 mg/kg.

Neither 4,4'-DDT nor either of the chlordane isomers (alpha-chlordane and gamma-chlordane) were detected in any of the samples (Table 16). The laboratory reporting limits for one of the nine samples, BB4EX104[0.5], were above cleanup levels for several OCPs, including the COCs. Based on the observation that no OCPs were detected in any of the other eight confirmation samples collected at BBDA 4 and that samples were collected at a much higher density at BBDA 4 than required in the RAP, the elevated reporting limits for this one sample were judged not to provide a basis for any further action.

Other Compounds

No non-COC metals were detected above associated cleanup levels (Table 15).

In accordance with the RAP, 10 percent of the soil confirmation samples were analyzed for an expanded suite of chemical analyses which included PCBs, TPHd, TPHfo, VOCs, SVOCs, and chlorinated herbicides. Since only seven confirmation samples were collected, only one sample (BB4EX100[0.5]) and its duplicate (DUP100704A) were analyzed for these parameters.

No PCBs were detected and all laboratory reporting limits were below applicable cleanup levels (Table 17).

Detections of TPHd ranged between < 1 mg/kg and 2.1 mg/kg, well below the cleanup level of 700 mg/kg (Table 17). Detections of TPHfo ranged between < 5.1 mg/kg and 7.1 mg/kg, also well below the cleanup level of 980 mg/kg.

No SVOCs were detected at BBDA 4 (Table 18). For the two samples, the standard laboratory reporting limits were above applicable cleanup levels for two compounds, 1,4-dichlorobenzene and benzo(a)pyrene. Based on the observations that no other SVOCs (including 22 with RAP-based cleanup levels) were detected in either sample, the elevated reporting limits for these two compounds were judged not to provide a basis for any further action.

For VOCs, no compounds were detected, and all laboratory reporting limits were below applicable cleanup levels (Table 18).

No chlorinated herbicides were detected in the BBDA 4 samples (Table 19).

QA/QC Samples

In accordance with the QAPP, duplicate soil samples were collected and analyzed at a rate of 10 percent of the primary samples. Laboratory prepared trip blank samples were included in sample shipments containing samples for VOC analysis. The analytical results for the one soil confirmation sample duplicate are included in Tables 15 through 19. The analytical results for the trip blank samples are presented in Table 13. One trip blank sample for the BBDA 4 sample batch was submitted for VOC analyses with no VOCs detected.

All soil confirmation samples at BBDA 4 were collected by pushing the sample tube into the native material; thus no sampling equipment was used. Therefore, no equipment rinsate blank samples were required.

3.3.2.4 BBDA 4 Soil Confirmation Sample Data Validation

VOCs

Reporting Limits: Reporting limits were somewhat elevated for acetone, methylene chloride, and vinyl acetate, as well as bromoform, bromomethane, chloroethane, and chloromethane. For all other samples, the laboratory reporting limits met the project required reporting limits.

SVOCs

Reporting Limits: Reporting limits were somewhat elevated for 2-nitrophenol and acenaphthene. For all other samples, the laboratory reporting limits met the project required reporting limits.

TPH Diesel/Fuel Oil Range

The laboratory reporting limit met the project-required reporting limit, and qualification was not required for any results.

Organochlorine Pesticides

Reporting Limits: The results for all compounds in samples BB4EX104[0.5] were reported as non-detect at a twenty-fold dilution due to the nature of the sample matrix. For all other samples, the laboratory reporting limits met the project required reporting limits.

Continuing Calibration: Samples BB4EX104[0.5], BB4EX106[0.5] and BB4EX107[0.5] were non-detect for 4,4'-DDT and endrin ketone and were qualified as estimated (UJ).

Polychlorinated Biphenyls

The laboratory reporting limits met the project-required reporting limits, and qualification was not required for any results.

Chlorinated Herbicides

The laboratory reporting limits met the project-required reporting limits, and qualification was not required for any results.

Metals

The laboratory reporting limits met the project-required reporting limits, and qualification was not required for any results.

Field Duplicate Samples

One sample was collected in duplicate at the BBDA 4 site. The calculated RPDs met the 50% precision control requirement.

3.3.3 BBDA 4 Waste Stream Disposal

Only two types of wastes were removed from BBDA 4 during the remedial action, which were disposed at appropriate off-site facilities. The following sections present the quantities and final disposition for the waste materials removed from BBDA 4. The total quantity of waste removed

from BBDA 4 is 736 tons (Table 14). The reported waste tonnages are compiled from the waste manifests and weight tickets received from each waste facility and are included in Appendix H. The volumes are estimated based upon an overall conversion factor of 1.63, which was calculated by dividing the total tonnage (736 tons) by the total bank cubic yards excavated (452 cy). The conversion factor represents an average unit weight (tons per bank cubic yard) for all excavated material. The actual unit weights cannot be determined, as individual waste stream volumes could not be measured in-place, prior to excavation.

3.3.3.1 Recycled Material

No recyclable materials were found at BBDA 4.

3.3.3.2 Green Waste (Vegetation and Soil), Class III Disposal

Approximately 85 tons (approximately 52 cy) of mixed vegetation and soil were disposed at the Ox Mountain Landfill.

3.3.3.3 Contaminated Soil, Class II Disposal

A total of approximately 651 tons (approximately 400 cy) of Class II contaminated soil and concrete were removed to Altamont for disposal.

3.3.4 BBDA 4 Surface Restoration

3.3.4.1 Final Grading

After completion of the confirmation sampling program, the excavated area was only minimally re-graded to facilitate proper drainage of the site and achieve an acceptable appearance. Final topography of BBDA 4 is shown on Figure 7 and Figure 9.

3.3.4.2 Final Erosion Control

As presented in the Plans and Specs, the final finished surface of the site required certain erosion control features to stabilize the site prior to the establishment of vegetation. Following the contouring of the slope, the planned erosion control devices were installed (Photo 31). These devices include a bio-degradable erosion control mat placed across the excavated slope, a silt fence at the lower edges of the slope, and straw wattles placed along topographic contours at several locations across the slope (Figure 7).

The erosion control materials were installed in accordance with the Plans and Specs. The straw wattle was placed along a pre-determined topographic contour. The position of the straw wattle was fixed using a surveyor to mark the specific line of topographic contour, and wattle was then installed and staked into place. The wattle is positioned along the 138-foot topographic contour across the site (Figure 7). Additionally, a run of wattle was placed along the northern edge of

Battery Chamberlin Road to prevent rainwater runoff from the road across that slope of the site. On 16 November 2004, a final site inspection and approval of the erosion control installation was conducted by the Project Engineer and CQA Officer, Mr. Wendell Minshew.

Observations during the excavation work indicated that an existing storm drain outfall from Lincoln Boulevard once discharged directly onto BBDA 4, but is currently filled in with soil (Figure 7). If it were to be cleaned out and returned to service, discharge from the storm drain during rains would potentially cause concentrated run-off through the swale, resulting in considerable erosion of the excavated area of BBDA 4. The Trust, in consultation with NPS, decided to abandon the subject storm drain in place. The work was performed in April 2005. This was accomplished by sealing the storm drain invert with asphalt.

3.3.4.3 Re-vegetation

Native vegetation restoration planting began in January 2005 and continued through Spring 2005. Additional planting and maintenance work may continue on an intermittent basis, at the discretion of NPS, and all work will be performed by NPS.

3.3.4.4 Post-Construction Erosion Control Monitoring

The Trust will continue to perform storm water inspections, prepare annual compliance reports, and monitor erosion control in accordance with the SWPPP, the SWRCB general permit, and the Trust's Erosion Monitoring Plan (Treadwell & Rollo, 2004d).

4.0 BBDA 3 GROUNDWATER AND SURFACE WATER MONITORING

As described in the Work Plan, two temporary piezometers were installed and sampled during the January 2004 slope stability field investigation. Boring and piezometer installation logs as well as sampling results are presented in the *Slope Stability Evaluation Report for Baker Beach Disturbed Area 3* (Treadwell & Rollo, 2004b). As discussed previously, these piezometers were abandoned prior to the initiation of remedial excavation work. As outlined in the RAP and Work Plan, three new groundwater monitoring wells and one surface water monitoring point were to be installed at BBDA 3 to monitor for potential contaminant migration from the site following clean closure remedial activities. The information obtained from the installation and sampling of the two temporary piezometers was used to guide the selection of the monitoring well locations and estimated completion depths.

On 27 October 2004, a site walk was conducted with representatives from the DTSC, Trust, NPS, and Treadwell & Rollo to discuss the proposed groundwater and seep monitoring locations for BBDA 3. As agreed among all the parties present during this site walk, two groundwater monitoring wells (BB3GW100 and BB3GW101) and four seep monitoring locations including one piezometer (BB3PZ101) and three fixed water monitoring points (BB3SW100, BB3SW101, and BB3SW102) were installed at BBDA 3 (Figure 5). Details on the site geology and hydrogeology and the new monitoring well and fixed water monitoring point locations, development, and sampling are presented in the following sections.

4.1 BBDA 3 Geology and Hydrogeology

A geologic cross section of the site is shown in Figure 11. As indicated in cross section A-A', prior to excavation the site was overlain by a layer of waste fill material up to 35 feet thick, consisting largely of sand mixed with construction debris and some municipal waste. This material was removed during remedial excavation. Near Lincoln Boulevard, a wedge of fill sand, which was placed to stabilize the road, is present. The upper portion of former BBDA 3 is now overlain by an exposed native beach/dune sand layer, approximately 10 to 20 feet thick and underlain by Colma formation soils. Approximately mid-way down the centerline of the excavated area, the beach/dune sand layer pinches out, and Colma soils are exposed. The Colma Formation is underlain by Franciscan complex bedrock, consisting of serpentinite and shale. Based on information collected to date, groundwater at the site flows generally westward. The groundwater has a surface water expression at the Colma/dune sand contact, along the northern flank of the ravine. It emerges as surface water seeps between the fixed water monitoring points BB3SW100 and BB3SW102.

As outlined above, following remedial excavation, two new groundwater monitoring wells, one piezometer, and three fixed water monitoring points were installed in the vicinity of former BBDA 3. Boring logs and well completion details are presented in Appendix I. Figure 11 presents a generalized geologic cross section based upon the boring logs of the recently installed monitoring

wells and existing data from the remedial excavation as well as historical site investigation activities. Materials encountered at monitoring wells BB3GW100 and BB3GW101 consisted of fill sand and native beach/dune sand to depths ranging from 21 feet to 36 feet bgs over stiff clays of the Colma Formation. At BB3GW101, Colma soils were present to a depth of 31 feet bgs, but BB3GW100 was terminated in the Colma Formation at a depth of 36.5 feet. Boring BB3GW101 was terminated in Franciscan complex shales and serpentine at a depth of 31.5 feet bgs. Saturated soils were encountered at approximately 30.5 feet bgs in the boring for BB3GW100 but were not encountered in the soil boring for BB3GW101.

Materials encountered while hand augering for piezometer BB3PZ101 consisted generally of dune sand to a depth of 17.5 feet bgs over sandy clay of the Colma Formation. Piezometer BB3PZ101 was terminated in the Colma Formation at 18 feet bgs, and saturated soils were encountered at approximately 16.5 feet bgs.

Well BB3GW100 is located immediately upgradient of the excavated area, at the toe of the buttress fill supporting Lincoln Boulevard and at the edge of Battery Crosby Road (Figure 5). Well BB3GW101 is located within the northern portion of the excavated area of former BBDA 3. Piezometer BB3PZ101 and fixed water monitoring points BB3SW100 through BB3SW102 are located generally along the centerline of the ravine than runs east-west across the excavated area. At well BB3GW100, the groundwater surface is located within dune sand at 30.5 feet bgs and approximately 5.5 feet above the Colma Formation contact (Figure 5 and Appendix I). At well BB3GW101, the groundwater was not present at the time of well installation to a depth of approximately 31 feet bgs but is likely located within the Franciscan complex, deeper than the bottom of the well (Appendix I). At piezometer BB3PZ101, water was encountered at a depth of 16.5 feet in dune sand, approximately 1.5 feet above the Colma Formation contact. At fixed water monitoring points BB3SW100 and BB3SW101, water was not encountered during installation. At monitoring point BB3SW102, water was encountered in dune sand within a few inches of the ground surface.

4.2 Monitoring Well, Piezometer, and Fixed Water Monitoring Point Installation, Development, and Sampling

Drilling and monitoring well installation was performed at former BBDA 3 on 6 December 2004. Treadwell & Rollo supervised the drilling of the soil borings performed by Gregg Drilling and Testing, Inc. (Gregg Drilling) of Martinez, California. A track-driven, limited access drill rig equipped with 8-inch-diameter hollow-stem augers was used for drilling at the site (Photo 32). Soil borings were advanced below the water table to total depths of 37 feet bgs and 32 feet bgs for installation of wells BB3GW100 and BB3GW101, respectively. Soil samples were collected at 5-foot intervals in each boring for lithologic description. As outlined in the RAP, no soil samples were retained for chemical analyses. The materials encountered at each boring were logged according to the Unified Soil Classification System by a Treadwell & Rollo

field geologist under the supervision of a California-registered geologist. The boring and well completion logs are included in Appendix I.

Drilling and sampling equipment were cleaned between borings. The soil cuttings were placed in the existing on-site waste soil stockpiles prior to off-site disposal as part of the site remediation activities.

A groundwater monitoring well was installed in each of the two soil borings in accordance with the QAPP and Trust SOPs. The groundwater monitoring wells were constructed of 2-inch-diameter Schedule 40 polyvinyl chloride (PVC) casing with flush threads and 0.020-inch-slot well screen. A 10-foot length of well screen was installed for each well. Blank well casing was installed from the top of the screened casing to 3 feet above the ground surface. A sand filter pack (No. 2/12 sand) was installed in the borehole annulus from the bottom to approximately 1/2 foot to 1 foot above the screened casing. A 1-foot-thick seal of hydrated bentonite pellets was placed above the sand filter pack. The remainder of the borehole annulus was sealed with a neat cement grout. A locking water-tight well cap was placed on the well casing. The wells were completed with a monument ("stovepipe") surface box to protect the wellhead and to prevent water from entering the well. Well construction details are shown in Table 20 and on the boring logs (Appendix I).

On 13 December 2004, piezometer BB3PZ101 was installed in a hand-augered boring to a total depth of 18 feet. The materials encountered in the boring were logged according to the Unified Soil Classification System by a Treadwell & Rollo field geologist under the supervision of a California-registered geologist. The piezometer was constructed of 2-inch-diameter Schedule 40 PVC casing with flush threads and a 15-foot length of 0.020-inch-slot well screen. Blank well casing was installed from the top of the screened casing to 3 feet above the ground surface. The borehole annulus was backfilled to ground level with the local native dune sand. A locking water-tight well cap was placed on the well casing. A protective metal surface completion to prevent surface water from entering the well was not installed. The boring and well completion logs are included in Appendix I.

Three fixed water monitoring points were also installed at former BBDA 3 on 8 December 2004. Treadwell & Rollo performed the hand-augering and installation of the fixed water monitoring points (Photo 33). To install the fixed water monitoring points, a borehole was hand-augered to a depth of approximately 2.5 feet bgs for points BB3SW100, BB3SW101, and BB3SW102. The materials encountered at each boring were logged according to the Unified Soil Classification System by a Treadwell & Rollo field geologist under the supervision of a California-registered geologist. No soil samples were collected for chemical analyses. Augering equipment was cleaned between borings according to SOPs. The soil cuttings were used as backfill. The boring and well completion logs are included in Appendix I.

A fixed water monitoring point was installed in each of the three hand-augered borings. The QAPP and Trust SOPs do not provide any guidance for this type of installation. The monitoring points were constructed of 2-inch-diameter, 5-foot length Schedule 40 PVC casing with 0.020-inch-slot well screen. The top of the screened casing extends approximately 2 feet above the ground surface for all monitoring points. The native dune sand was placed in the borehole annulus from the bottom of the screened casing to the ground surface. A locking water-tight well cap was placed on the well casing. The fixed water monitoring point was finished without outer protective metal casings (Photo 28). Fixed water monitoring point construction details are shown in Table 20 and on the boring logs (Appendix I).

On 14 December 2004, well BB3GW100 was developed by Blaine Tech Services using surge and purge bailing methods in accordance with the QAPP and Trust SOPs. Groundwater field parameters (temperature, pH, conductivity, and turbidity) were measured and recorded throughout development. Development continued until the water removed from the monitoring well showed stabilization of field parameters, was relatively free of suspended sediments, or dry. Development was performed to enhance hydraulic connection between the well and the native formation. The purged water was stored in temporary water storage tanks located at the Central Magazine pending testing and disposal to the sanitary sewer under the Trust's industrial wastewater discharge permit. The well development log is included in Appendix J. A water level measurement in new monitoring well BB3GW101 indicated that the well was dry.

On 23 December 2004, Chaudhary & Associates, in conjunction with periodic slope stability monitoring, surveyed the top of casing elevations of the newly installed monitoring wells and surface water monitoring points. In accordance with the QAPP, the horizontal values are based on NAD27, Zone 3, and the elevations are referenced to Presidio Lower Low Water datum of 1907 (PLLW). The surveyed locations and elevations for wells BB3GW100 and BB3GW101, piezometer BB3PZ101 and fixed water monitoring points BB3SW100 through BB3SW102 are included on the boring logs (Appendix I). Top of casing elevations are also shown in Table 20.

4.3 Groundwater and Surface Water Sampling

No groundwater monitoring activities took place at BBDA 3 during the Third Quarter 2004 because the remedial action was in progress and no groundwater monitoring well, piezometer, or fixed water monitoring point locations had yet been established. During the Fourth Quarter 2004, groundwater elevations were measured and groundwater sampling was attempted at BBDA 3 within the two new groundwater monitoring wells (BB3GW100 and BB3GW101) and the four seep monitoring locations, including the one piezometer (BB3PZ101) and the three fixed water monitoring points (BB3SW100 through BB3SW102). BBDA 3 sampling locations BB3GW101 and BB3SW100 were dry during the Fourth Quarter 2004 and therefore no groundwater elevations or samples were collected at these locations.

Water level meters were calibrated on 13 December 2004. The calibration logs can be found in Appendix J. Groundwater elevation field forms can also be found in Appendix J.

4.3.1 Groundwater Level Measurements and Interpretation

As stated above, no groundwater elevation measurements were collected during the Third Quarter 2004. Groundwater elevation measurements during the Fourth Quarter 2004 were collected on 13 December 2004 at monitoring well BB3GW100, piezometer BB3PZ101, and fixed water monitoring point locations BB3SW101 and BB3SW102. Monitoring well BB3GW101 and fixed water monitoring point location BB3SW100 were dry on 13 December 2004 and therefore no groundwater elevation data were collected.

During the Fourth Quarter 2004, groundwater elevations were 161.04 and 140.17 feet above PLLW in monitoring well BB3GW100 and BB3PZ101 piezometer, respectively. Groundwater elevations were also measured at BB3SW101 (75.76 feet above PLLW) and BB3SW102 (112.66 feet above PLLW) during the Fourth Quarter 2004. Groundwater elevations are illustrated on Figure 12.

To gain a broader understanding of groundwater gradients and flow directions in the BBDA 3 area, the groundwater elevations were evaluated with Fill Site 5 measurements. During the Fourth Quarter 2004, the groundwater flow direction across BBDA 3 was observed to be in a southwesterly direction toward the Pacific Ocean following the general topographic trend. The groundwater gradient at BBDA 3 between BB3GW100 and BB3PZ101 was calculated to be approximately 0.16 feet per foot during the Fourth Quarter 2004. Additionally, the groundwater gradient between LF5GW101 and BB3PZ101 was calculated to be approximately 0.25 feet per foot during the Fourth Quarter 2004.

4.3.2 Monitoring Well Purging and Sampling

During the Fourth Quarters 2004, BBDA 3 monitoring well BB3GW100 was purged and sampled on 14 December 2004. Monitoring well BB3GW101 was dry during the Fourth Quarter 2004 and therefore could not be purged or sampled. The piezometer BB3PZ101 and fixed water monitoring points BB3SW101 and BB3SW102 were sampled on 16 and 17 December 2004. Fixed water monitoring points BB3SW100 was dry during the Fourth Quarter 2004 and could not be sampled. Fixed water monitoring point BB3SW101 did contain water, but dewatered during sampling activities and did not recharge sufficiently for a complete sample suite to be collected. All sampling locations were sampled in accordance with methods shown in Table J-1 and procedures described in the *Field Sampling Plan* (Treadwell & Rollo, 2001). As noted, the monitoring wells are listed as “modified” (purged and sampled); the piezometer and fixed water monitoring points as “surface” (no purge, sample only).

Purging equipment, purging volumes, purge water parameters, and sampling equipment for each sampling location are described in the purge records at the conclusion of this section. Purge water was stored for future disposal in one of two 2,800-gallon aboveground polyethylene storage tanks, which are located at the Central Magazine.

4.3.3 Groundwater Analytical Program

As presented in Section 2.3.2, all groundwater samples were submitted to the project laboratory for the following analyses: TPHg, TPHd, and TPHfo, 22 total (seep samples only) and dissolved metals, general chemistry analyses, and dissolved oxygen.

QA/QC samples were collected as part of this program. Section 2.3 discusses the QA/QC sampling and analysis performed for the Fourth Quarter.

4.4 Groundwater Analytical Results

No groundwater samples were collected at BBDA 3 during the Third Quarter 2004 because the remedial action was in progress and no groundwater monitoring wells or seep locations had yet been established. During the Fourth Quarter 2004, groundwater samples were collected from one new monitoring well (BB3GW100), the one piezometer (BB3PZ101) and two fixed water monitoring points (BB3SW101 and BB3SW102). Monitoring well BB3GW101 and fixed water monitoring point BB3SW100 were observed to be dry during the Fourth Quarter 2004 and therefore could not be purged and/or sampled. As noted above, fixed water monitoring point BB3SW101 dewatered during sampling and did not recharge water sufficiently, and therefore a complete sample suite could not be collected. With the exception of fixed water monitoring point BB3SW101, all samples were analyzed for dissolved oxygen, general chemistry parameters, TDS, TPHg, TPHd, TPHfo, and dissolved metals. In addition, piezometer BB3PZ101 and fixed water monitoring point BB3SW102 were analyzed for total metals.

During evaluation of the preliminary groundwater data results from BB3PZ101 and BB3SW102 for dissolved metals, high concentrations prompted a call to the project laboratory. The laboratory identified a sample preparation error for the initial analytical run in December 2004 from BB3PZ101 and BB3SW102 of dissolved metals, which produced erroneous results. The samples were subsequently correctly prepared and re-analyzed in March 2005. The results of dissolved metals for BB3PZ101 and BB3SW102 presented in this report reflect the March 2005 analytical run.

A sufficient amount of data has not yet been collected to evaluate concentration trends and therefore, a discussion of relative concentrations of the detected analyses between the wells and fixed water monitoring points is provided below.

Current and historical groundwater and seep analytical results are presented in Tables 21 through 24.

4.4.1 Dissolved Oxygen and General Chemistry Results

Dissolved oxygen results are presented in Table 21. During the Fourth Quarter 2004 dissolved oxygen ranged from 2.2 and 8 mg/L in monitoring wells BB3GW100 and fixed water monitoring point BB3SW101, respectively. A sufficient amount of dissolved oxygen data has not yet been collected from these locations to develop trends, but higher concentrations of dissolved oxygen are observed in the shallower fixed water monitoring points and the piezometer versus the monitoring well. This initial trend may be a result of the sampling methodology differences (purge and sample verses no purge, sample only) between the monitoring well and fixed water monitoring point locations.

General chemistry analytical results are presented in Table 21. In general, nitrate and sulfate concentrations were slightly higher in piezometer BB3PZ101 and fixed water monitoring point BB3SW102 than in monitoring well BB3GW100. Conversely, the chloride concentration detected in monitoring well BB3GW100 is higher than those detected in BB3PZ101 and BB3SW102. This trend will continue to be monitored during future sampling events.

4.4.2 TPH Results

The analytical results for TPHg, TPHd, and TPHfo, along with the RAP-specified cleanup levels, are presented in Table 23. No TPH compounds were detected above laboratory limits within any groundwater or seep (fixed water monitoring point and piezometer) samples collected from BBDA 3 during the Fourth Quarter 2004.

4.4.3 Total and Dissolved Metals Results

The total and dissolved metals results for Fourth Quarter 2004, along with RAP-specified cleanup levels, are presented in Table 24. All BBDA 3 groundwater and seep (fixed water monitoring point and piezometer) samples collected during the Fourth Quarter 2004 were analyzed for dissolved metals. At the request of DTSC, seep samples (BB3PZ101 and BB3SW102) were also analyzed for total metals using unfiltered samples in order to collect data that can be used in ecological risk comparisons.

No dissolved metals were reported in excess of RAP-specified cleanup levels in either groundwater or seep samples.

Two seep samples had total metals results that exceeded RAP-specified cleanup levels for dissolved metals. Total copper was detected above the RAP-specified cleanup level for dissolved copper of 11.8 microgram per liter (µg/L) within BB3PZ101 and BB3SW102 during the Fourth Quarter 2004. Additionally, total nickel was detected above the RAP-specified cleanup level for dissolved nickel of 100 µg/L within BB3SW102 (150 µg/L) during the Fourth Quarter 2004.

As noted previously, the unfiltered samples for total metals analyses were collected at the request of DTSC for use in ecological risk comparisons. However, for the protection of ecological receptors, the RAP-specified cleanup levels for copper are from the Basin Plan, which states that objectives for metals are expressed in terms of the dissolved fraction of the metal in the water column (RWQCB, 1995). Because the surface water criteria from the Basin Plan are expressed in terms of dissolved concentrations rather than total concentrations, it is more appropriate to compare the dissolved concentrations to the RAP-specified cleanup levels for the purposes of assessing the potential for water quality impacts for ecological receptors. Because dissolved copper concentrations in BBDA 3 seep samples did not exceed the RAP-specified cleanup level for dissolved copper, ecological impacts from copper in the seep water are not expected.

The RAP-specified cleanup level for nickel is a drinking water maximum contaminant level (MCL). While the MCL is based on a total nickel concentration, unfiltered seep samples from the site are not representative of metals concentrations at the point of exposure for dinking water purposes or within a drinking water supply system. The total nickel concentrations of 59 μg/L at BB3PZ101 and 150 μg/L at BB3SW102, as well as the dissolved nickel concentrations (<20 μg/L at both locations), do not exceed the surface water quality criterion from the Basin Plan of 158 μg/L for dissolved nickel (EKI, 2002). Therefore, ecological impacts from nickel in BBDA 3 seep water are also not expected.

Clear trends are not yet apparent for BBDA 3 total and dissolved metal concentrations. Future total and dissolved metal results will be collected at BBDA 3 as part of the Presidio-wide Groundwater Monitoring Program in accordance with the RAP and trends will be identified as they become apparent.

4.4.4 BBDA 3 Groundwater Sample Data Validation

VOCs

Reporting Limits: Reporting limits for the trip blank sample were somewhat elevated for bromoform, bromomethane, chloroethane, and chloromethane. For all other samples, the laboratory reporting limits met the project-required reporting limits.

TPH Gasoline Range

The laboratory reporting limit met the project-required reporting limit, and qualification was not required for any results.

TPH Diesel/Fuel Oil Range

The laboratory reporting limit met the project-required reporting limit, and qualification was not required for any results.

Metals

The laboratory reporting limits met the project-required reporting limits, and qualification was required for one sample result. Sample LF4GW103 was the parent sample used for the QC batch. The serial dilution for dissolved calcium failed in this parent sample at 14%, which is outside the 10% difference acceptance criteria. All samples in the same QC batch were qualified as a result of the failure. Sample BB3GW100 was in the QC batch, and was qualified (J) due to this failure.

General Chemistry and TDS

The laboratory reporting limit met the project-required reporting limit, and qualification was not required for any results.

Field Duplicate Samples

Field duplicate samples were collected in accordance with the Presidio-wide Monitoring and Sampling Program. Groundwater duplicates samples were collected and submitted to two separate analytical laboratories for a QC check. No field duplicates were collected at the BBDA 3 site. However, a total of nine field duplicate samples were collected and sent to the primary analytical laboratory (Curtis & Tompkins) and five field duplicates were collected and sent to a separate analytical laboratory (Columbia Analytical) as a QC check. The results of the field duplicate analyses are reported in the *Semi-Annual Groundwater Monitoring Report, Third and Fourth Quarters 2004* (Treadwell & Rollo, 2005a).

5.0 VARIANCES FROM WORK PLAN

Based on technical and practical considerations, certain aspects of the BBDA 3 and BBDA 4 remedial work deviated from the Work Plan (Treadwell & Rollo, 2004d) and Construction Plans and Specifications (Minshew Engineering and Treadwell & Rollo, 2004). Variances from these documents are described below.

5.1 Increase in Excavation Volume at BBDA 3 and 4

As stated in the RAP and noted in Sections 1.1.1.1 and 1.1.1.2, the pre-construction estimated volume of fill material at BBDA 3 was 33,000 cy, and the estimated volume of impacted fill material at BBDA 4 was 180 cy. The actual volumes excavated from BBDA 3 and BBDA 4 were 37,493 and 452 bank cubic yards, respectively, as calculated from field surveys performed before and after excavation (Figures 8 and 9).

5.2 Actual Limits of Waste Differ from Limits Indicated in RAP

The estimated limit of fill outlined in the RAP for the northwestern quadrant of BBDA 3 was found to be located farther south and downslope. A visual field inspection of the slope indicated that the material present did not consist of fill. This conclusion was based on the presence of native beach/dune sand revealed by potholing the area and verified by confirmation sampling. Sampling locations BB3EX102[0.5], BB3EX105[0.5], BB3EX110[0.5], and BB3EX135[0.5] are located on the slope, and analytical results for these samples meet all applicable cleanup levels. Therefore, the actual limits of waste were adjusted such that this slope was not excavated. As indicated on Figure 4, the remediation contractor, at the direction of NPS personnel, removed non-native vegetation growing on the slope while not disturbing remaining native vegetation. As the excavation progressed upslope (eastward), visual cues were used to determine the interface between fill and native soil which were then verified by confirmation sampling and analysis. The limits of fill estimated in the RAP and the actual limits of fill are both indicated on Figure 4.

5.3 BBDA 3 Combined Perimeter and Grid Sampling Locations

Section 2.9.2 of the Work Plan states that bottom samples will be collected on a 75- by 75-foot sampling grid, and that perimeter samples will be collected at a rate of one sample per 75 feet of the perimeter extent. No sidewall sampling was found to be necessary, as no sidewalls in excess of 1 foot in height were created by the remedial excavation. During confirmation sampling, it was noted that some of the bottom/grid samples were located along or very close to the perimeter of the excavation. During the site walk on 27 October 2004, DTSC accepted the suggestion to allow, where appropriate, the same sample to serve as both a “bottom” and a “perimeter” sample; all such sampling locations were approved by DTSC during the final site walk of 5 January 2005. The “combined” sampling locations are indicated on Figure 4 with a unique symbol.

5.4 Additional Sampling Requested by DTSC

During the 27 October 2004 site walk with DTSC, the Trust, and Treadwell & Rollo representatives to discuss BBDA 3 and BBDA 4 confirmation sample results, it was agreed that several additional sampling locations along the approximate centerline of the ravine excavated east-west across the site were needed. A visual inspection of the sampling grid indicated that existing bottom/grid sample locations would not provide coverage along the lowest points (the bottom of the ravine) across the site. Therefore, sampling locations BB3EX116[0.5], BB3EX130[0.5], BB3EX138[0.5], and BB3EX139[0.5] were added to fill this data gap. All confirmation sampling locations are shown on Figure 4.

5.5 Erosion Control Measures and Re-vegetation at BBDA 3

With the onset of rains in December 2004, it became apparent that erosion control measures would need to be augmented across the BBDA 3 site to decrease the rate of erosion that was taking place. Thus, some of the final erosion control measures for BBDA 3 indicated on Figure 5 differ, in localized areas, from those shown in the project plans. It should be noted that although the final erosion control plan for BBDA 3 showed that the entire site would be covered by erosion control fabric, NPS had indicated during design consultations that blanket coverage over exposed dune sand would be highly undesirable. A dynamic, open sand dune environment was preferred by the NPS for implementing the site re-vegetation plan. Since it was not known in advance what portion of the native material exposed by waste excavation would be dune sand (as opposed to Colma formation clays or serpentinite), it was decided that for bidding purposes the drawings would show erosion control fabric across the entire site, but a note was added explaining that field adjustments to the location and type of erosion control materials would be made in consultations among the Trust, NPS, and design engineer to accommodate conditions actually encountered. Since the native material actually exposed was largely dune sand, only a limited amount of erosion control fabric was installed in the lower portion of BBDA 3 in conjunction with the sand bag check dams and silt fencing.

The installation of sand bag check dams and a pipe to collect and divert seep water flow to the beach were added as a modification to the original final erosion control measures presented in the Plans and Specs. Periodic rainfall is effectively managed by the straw wattle and silt fence erosion control measures. However, because the dune sand has little cohesion, the constant flow of water from the seeps caused severe erosion including incising and movement of the sand. The water flow was reduced by diverting the water. The sand bag check dams positioned at regular intervals near the bottom of the slope successfully slowed the flow of water and facilitated deposition of mobilized sand. An additional erosion control measure that was not included in the Plans and Specs but was installed by the NPS is the willow mattress located at the toe of the slope.

5.6 Slope Stability Monitoring for Lincoln Boulevard

The Work Plan did not call for any slope stability monitoring. However, at the request of DTSC and as recommended in the *Slope Stability Evaluation Report for Baker Beach Disturbed Area 3* (Treadwell & Rollo, 2004b), three slope stability monitoring points were established along Lincoln Boulevard, at the top of the engineered fill embankment supporting the road. These points were surveyed approximately every two weeks, and the results forwarded to the Trust. As noted in Section 3.2.1, the survey data, specifically the accumulative horizontal and vertical movement, were examined each time to assess whether any movement had taken place. The magnitude of the net movement observed during the last surveying event (-0.011 to 0.016 feet) was within the margin of acceptable measurement variability and/or road conditions such as thermal expansion or vibration from passing vehicles during surveying. Thus all measurements indicated that site excavation activities had no adverse impact on the slope that supports Lincoln Boulevard (Table 5).

5.7 Steeper Post-Excavation Slopes at BBDA 3

Although the areal extent of the waste was not as large as had been anticipated in the RAP, it was found that the depth of waste at BBDA 3 was greater than anticipated. Consequently, the final slopes at BBDA 3, particularly at the eastern end of the exposed ravine immediately below Battery Crosby Road, are somewhat steeper than anticipated in the project plans. A post-construction analysis preformed by Treadwell & Rollo and documented in the *Slope Stability Evaluation of Final Slope Configurations, Baker Beach Disturbed Area 3* memorandum (Treadwell & Rollo, 2005b) indicates that these slopes will likely be prone to localized shallow raveling-type erosional failures (Appendix K). These types of failures will likely continue on the steep slopes on the north and south sides of the ravine. Furthermore, the steep slopes at the western boundary of BBDA 3 will continue to be marginally stable, as the Factor of Safety is approximately 1.3.

5.8 Changes to the BBDA 3 Groundwater and Surface Water Monitoring Network

Section 2.5 of the Work Plan calls for the installation and monitoring of three new groundwater monitoring wells and the monitoring of at least one surface water seep at BBDA 3. The post-construction topography of the BBDA 3 site made it infeasible to access the center of the former landfill footprint with even a limited-access drill rig. Therefore, in consultation with representatives of the DTSC, Trust, NPS, and Treadwell & Rollo during a site walk on 27 October 2004, it was agreed to locate fixed water monitoring points not only at the downgradient edge of the excavated area (BB3SW100), but also in three locations along the approximate centerline of the ravine that bisects the site east to west (BB3SW101, BB3SW102, and BB3PZ101). Two groundwater monitoring wells, BB3GW100 and BB3GW101, were installed in general accordance with the Work Plan. Final groundwater monitoring well and fixed water monitoring point locations are shown on Figure 12.

5.9 Stockpiling of Excavated Material from BBDA 4

Section 2.7.2 of the Work Plan anticipated that some stockpiling and segregation of material may occur on the portion of Battery Chamberlin Road immediately adjacent to the site at BBDA 4. All the material excavated from BBDA 4 was classified as Class II waste, whereas a relatively small portion of BBDA 3 material was Class II. It was therefore more expedient to stockpile the BBDA 4 material alongside the Class II BBDA 3 material within the footprint of BBDA 3 so that all of the material could be off-hauled at the same time using the same fleet of trucks.

6.0 SUMMARY AND CONCLUSIONS

Between 8 July 2004 and 13 January 2005, a total of 57,914 tons (approximately 37,493 cy) of waste material was removed from former BBDA 3. The majority of the material (75 percent) was disposed as Class I CalHaz waste based on the soluble lead concentrations. Soil confirmation sample concentrations, 95% UCL calculations, or other data evaluation methods determined that the site conditions meet the goals presented in the RAP for all compounds tested (both COC and non-COC compounds). All waste material has been removed from BBDA 3. As anticipated in the RAP and as documented in this report, BBDA 3 meets the "target" human health criteria for residential land use in addition to being protective of special status species ecological receptors. BBDA 3 is therefore suitable for unrestricted land use.

Between 5 and 7 October 2004, a total of 600 tons (approximately 452 cy) of waste material was removed from the former BBDA 4 site. Approximately 86 percent of the fill material was disposed as Class II waste, and the remainder was disposed as Class III waste. Soil confirmation sample concentrations for all compounds tested (both COC and non-COC compounds) determined that the site soil conditions meet the goals presented in the RAP. All impacted fill material has been removed from BBDA 4. As anticipated in the RAP and as documented in this report, BBDA 4 meets the "target" human health criteria for residential land use in addition to being protective of special status species ecological receptors. BBDA 4 is therefore suitable for unrestricted land use.

Both BBDA 3 temporary piezometers were abandoned in June 2004, prior to commencement of remedial construction activities. No groundwater monitoring activities took place at BBDA 3 during the Third Quarter 2004 because the remedial action was in progress and no groundwater monitoring wells or seep monitoring locations had yet been established. Following the excavation activities, two groundwater monitoring wells and four seep monitoring points (one piezometer and three fixed water monitoring points) were installed and included in the Presidio-wide Groundwater Monitoring Program. Due to limited data collected to date, no significant trends were identified during the Fourth Quarter 2004 at BBDA 3. Future detections and trends will continue to be monitored and evaluated in accordance with the RAP. Groundwater and seep monitoring will continue per the RAP for three years as part of the Presidio-wide Groundwater Monitoring Program. The data will then be reviewed to determine whether applicable cleanup levels have been achieved and monitoring is considered complete.

Based on the remedial activities conducted, field observations, established cleanup levels, and a review and evaluation of the confirmation sampling results, BBDA 3 and BBDA 4 are recommended for construction completion.

Notes
mg/kg - milligrams per kilogram
Shading indicates target cleanup levels.

[1] Cleanup levels for soil are based on the most stringent of the values for protection of human health (recreational or residential land use), protection of ecological receptors (ecological special status species and terrestrial receptors), and maintaining drinking water standards in groundwater (soils greater than 5 feet above groundwater). In the case of metals, if the background concentration for a particular lithology (Serpentinite, Colma, or Beach/Dune Sand, as noted) is greater than the most stringent cleanup level, then the background concentration applies as the cleanup level. Source: Table 7-2 (non-petroleum compounds) and Table 7-5 (petroleum hydrocarbons and constituents) in the Cleanup Levels Document (EKI, 2002).

[2] Cleanup levels for serpentinite, Colma, and beach/dune sand have been approved in the RAP (Treadwell & Rollo, 2004a). Cleanup levels for chert have been derived from the Clean Levels Document (EKI, 2002).

Endosulfan Sulfate	0.004	0.002	1.1
Endrin	0.004	0.002	0.004
Endrin Aldehyde	--	0.002	0.004
Endrin Ketone	0.004	0.002	0.004
gamma-BHC (Lindane)	0.002	0.002	0.010
Heptachlor	0.002	0.002	0.017
Heptachlor Epoxide	0.002	0.002	0.017
Isodrin	--	--	0.0039
MCPP	5.0	--	5.0
Methoxychlor	0.02	0.02	0.44
Petroleum Hydrocarbons (Method 8015 Modified)			
TPH as gasoline (C7 - C12)	1.0	1	610
TPH as diesel (C12 - C24)	10	1	700
TPH as fuel oil (C24 - C36)	10	5	980
BTEX Compounds (Method 8260B)			
Benzene	0.005	0.005	0.6
Ethylbenzene	0.005	0.005	60
Toluene	0.01	0.005	270
Total Xylenes	0.005	0.005	55

Notes
mg/kg - milligrams per kilogram
Shading indicates target cleanup levels.

[1] Cleanup levels for soil are based on the most stringent of the values for protection of human health (recreational or residential land use), protection of ecological receptors (ecological special status species and terrestrial receptors), and maintaining drinking water standards in groundwater (soils greater than 5 feet above groundwater). Source: Table 7-2 (non-petroleum compounds) and Table 7-5 (petroleum, hydrocarbons and constituents) in Cleanup Levels Document (EKI, 2002). These cleanup levels have been approved in the RAP (Treadwell & Rollo, 2004a).

Notes

1 - Sampling sequence indicates that if the initial confirmation sample exceeded a cleanup level, the area was overexcavated and a subsequent sample was collected at the current ground surface at the same location and reanalyzed for compounds exceeding cleanup levels.

2 - Metals include Antimony, Arsenic, Barium, Beryllium, Cadmium, Chromium, Cobalt, Copper, Iron, Lead, Manganese, Mercury, Molybdenum, Nickel, Selenium, Silver, Thallium, Vanadium, and Zinc.

3 Pre-1958 Road Fill consists of a mixture of Colma, beach/dune Beach/Dune Sand, and serpentinite. Analytical results are compared against the cleanup level for serpentinite.

Green indicates area was overexcavated.

DUP prefix indicates a blind duplicate sample.
4,4'-DDT - 4,4'-Dichlorodiphenyltrichloroethane
gamma BHC - gamma isomer of lindane (BHC)
PCB - Polychlorinated biphenyls
B(a)A - Benzo(a)anthracene
B(a)P - Benzo(a)pyrene
B(b)F - Benzo(b)fluoranthene
B(k)F - Benzo(k)fluoranthene
I(1,2.3)cd-P - Indeno 1,2,3-cd pyrene
TPH - Total petroleum hydrocarbons
SVOCs - Semivolatile organic compounds
VOCs - Volatile organic compounds

Notes
[1] Metals include Antimony, Arsenic, Barium, Beryllium, Cadmium, Chromium, Cobalt, Copper, Iron, Lead, Manganese, Mercury, Molybdenum, Nickel, Selenium, Silver, Thallium, Vanadium, and Zinc.
DUP Prefix indicates a blind duplicate sample.
PCBs - Polychlorinated biphenyls
TPH - Total petroleum hydrocarbons
SVOCs - Semivolatile organic compounds
VOCs - Volatile organic compounds

Table 4
Construction Completion Timeline
Baker Beach Disturbed Areas 3 and 4
Presidio of San Francisco, California

Date	Action/Event
29-Jan to 5-Feb-04	Temporary piezometers installed at BBDA 3
4 to 6-Feb-04	Jeffrey Steinman conducts survey to locate nesting birds at BBDAs 3 and 4
10-Feb-04	BBDA 3 Tree clearing
18-Mar-04	Remedial Action Plan approved by DTSC
9-Jun-04	Notice to Proceed issued to Perf-Ex
	Pre-excavation Activities
5-May-04	Perf-Ex issues Health Safety Plan.
4-Jun-04	Over-drill and abandon piezometer BB3PZ1B; Partial abandonment of piezometer BB3PZ1A.
9-Jun-04	Perf-Ex mobilize to BBDA 3, install construction fencing.
14-Jun-04	Potholing at BBDA3 to profile fill. PerfEx collects waste characterization samples from test pits.
16-Jun-04	Chaudhary Associates set slope movement monitoring points on Lincoln Boulevard.
21-Jun-04	RW Davis shoots pre-construction topographic survey for BBDAs 3 and 4.
22-Jun-04	BBDA 3 waste characterization analytical results indicate CA HAZ for lead.
28-Jun-04	NPS gives sensitive habitat awareness training at BBDA 3. Trust gives UXO awareness training.
30-Jun-04	Chaudhary Associates surveys slope monitoring points on Lincoln Boulevard. T&R collects preliminary chert road and native sand samples BB3SS100-BB3SS102 from historical chert road.
2-Jul-04	RW Davis shoots pre-construction topographic survey for BBDA 4.
	BBDA 3 Excavation
1-Jul-04	Begin removing green waste from slope of BBDA 3.
6-Jul-04	Begin to excavate and stockpile BBDA 3 fill soil. Import aggregate baserock and build up entrance ramp for trucks.
8-Jul-04	First truck tests site entry and exist, 1st load out Class I to Buttonwillow.
9-Jul-04	Bowley Road work hour closure for truck staging begins for daily Class I offhaul.
7-Jul-04	Test stockpile for Class II material.
13-Jul-04	Stockpile results show CA Class I material.
15-Jul-04	Test stockpile for Class II material.
16-Jul-04	Chaudhary Associates surveys slope monitoring points on Lincoln Boulevard.
19-Jul-04	Stockpile result show CA Class I material.
21-Jul-04	Mobilize long-reach excavator to site.
27-Jul-04	Following discussions with DTSC, Trust gives PerfEx approval to begin excavation in BBDA 3 Phase II area.
29-Jul-04	Results for Phase II area material indicate CA Class I waste.
30-Jul-04	T&R collects bottom confirmation sample BB3EX100[0.5]. Chaudhary Associates surveys slope monitoring points on Lincoln Boulevard.
2-Aug-04	T&R collects confirmation samples BB3EX101[0.5] through BB3EX105[0.5].
3-Aug-04	DTSC representatives Robert Boggs and Ram Ramanujam visit site.
4-Aug-04	Over excavate BB3EX100[0.5], T&R collects confirmation resample BB3EX106[0.5].
5-Aug-04	T&R collects confirmation samples BB3EX107[0.5] and BB3EX108[0.5].
6-Aug-04	T&R collects confirmation samples BB3EX109[0.5] and BB3EX110[0.5].

Table 4
Construction Completion Timeline
Baker Beach Disturbed Areas 3 and 4
Presidio of San Francisco, California

16-Aug-04	Chaudhary Associates surveys slope monitoring points on Lincoln Boulevard.
17-Aug-04	DTSC, Trust, NPS perform site walk, discuss confirmation sampling. DTSC requests additional samples from bottom of ravine.
18-Aug-04	T&R collects confirmation samples BB3EX111[0.5] through BB3EX116[0.5].
20-Aug-04	Begin Class II waste offhaul to Altamont, continue CA Class I offhaul.
23-Aug-04	End Class II waste offhaul to Altamont and continue CA Class I offhaul.
25-Aug-04	Perform vegetation removal outside work limits at NPS direction.
26-Aug-04	Over excavate BB3EX111, BB3EX115, and BB3EX116.
27-Aug-04	NPS constructs willow mat at toe of slope for erosion control.
	RW Davis shoots partial post-construction topographic survey, sample locations.
30-Aug-04	T&R collects confirmation samples BB3EX117[0.5] through BB3EX121[0.5].
31-Aug-04	Chaudhary Associates surveys slope monitoring points on Lincoln Boulevard.
7-Sep-04	Begin breaking large concrete prior to Class II offhaul.
9-Sep-04	End Class II concrete offhaul, continue CA Class I offhaul.
13-Sep-04	Resume Class II waste offhaul to Altamont, continue CA Class I offhaul.
	Over excavate BB3EX118 and BB3EX120.
	Groundwater seep noticed at former sampling location BB3EX118.
14-Sep-04	RW Davis shoots partial post-construction topographic survey, sample locations.
	Begin tree stump offhaul.
	T&R collects confirmation samples BB3EX122[0.5] through BB3EX127[0.5].
15-Sep-04	Chaudhary Associates surveys slope monitoring points on Lincoln Boulevard.
	End tree stump offhaul.
21-Sep-04	Over-drill and complete Piezometer BB3PZ1A abandonment.
	End Class II waste offhaul to Altamont and continue CA Class I offhaul.
24-Sep-04	Test stockpile for Class II and Class III material.
28-Sep-04	Stockpile result show Class II material.
	Last CA Class I material offhaul.
	Resume Class II waste offhaul to Altamont, and begin Class III offhaul to Ox Mountain.
29-Sep-04	Over excavate BB3EX122, BB3EX123, and BB3EX125 through BB3EX127.
	End Class III offhaul to Ox Mt.
1-Oct-04	RW Davis shoots partial post-construction topographic survey, sample locations.
	T&R collects confirmation samples BB3EX128[0.5] through BB3EX136[0.5].
	Groundwater seep noted near sample BB3EX130.
5-Oct-04	Halt activity at BBDA 3, work BBDA 4.
8-Oct-04	Resume Class II waste offhaul to Altamont and Class III to Ox Mt.
11-Oct-04	Test stockpile for Class II material.
13-Oct-04	Stockpile result show Class II material.
18-Oct-04	First rain over weekend, no affect on site.
	Begin exposing historical Battery Crosby Rd.
19-Oct-04	Chaudhary Associates surveys slope monitoring points on Lincoln Boulevard.
22-Oct-04	Resume Class II waste offhaul to Altamont, and begin Class III offhaul to Ox Mt. after recent rains.
	Begin erosion control installation from toe up.
25-Oct-04	Test stockpile for Class II material. No site work until 11/03/04.
27-Oct-04	DTSC, Trust, NPS perform site walk, discuss confirmation sampling and select groundwater monitoring locations.
2-Nov-04	Stockpile material Class II.
3-Nov-04	Excavate 2 trenches to map limits of historical Battery Crosby Rd.

Table 4
Construction Completion Timeline
Baker Beach Disturbed Areas 3 and 4
Presidio of San Francisco, California

5-Nov-04	RW Davis shoots partial post-construction topographic survey, sample locations. T&R collects confirmation samples BB3EX127[0.5] through BB3EX144[0.5].
22-Nov-04	RW Davis shoots partial post-construction topographic survey, sample locations. T&R collects confirmation samples BB3EX145[0.5] through BB3EX150[2.5].
23-Nov-04	T&R collects confirmation samples BB3EX151[0.5] through BB3EX154[0.5]
6-Dec-04	Drill and install groundwater monitoring wells BB3GW100 and BB3GW101.
9-Dec-04	Hand-auger and install fixed water monitoring points BB3SW100 through BB3SW102.
13-Dec-04	Hand-auger and install piezometer BB3PZ101.
14-Dec-04	Well BB3GW100 developed, BB3GW101 dry. Begin groundwater sampling at site.
15-Dec-04	Excavate and remove section of historical Battery Crosby Rd which failed cleanup criteria. T&R collects confirmation sample BB3EX155[0.5].
16-Dec-04	T&R collects confirmation sample BB3EX156[0.5], last confirmation sample. Tires offhauled for recycling.
17-Dec-04	End Class II waste offhaul.
21-Dec-04	DTSC, Trust, NPS site meeting, confirmation sample results review. DTSC requests additional surface cleanup (scraping) at one location.
23-Dec-04	Chaudhary Associates surveys slope monitoring points on Lincoln Boulevard.
4-Jan-05	Scrape and remove surface material in the vicinity of samples BB3EX110, BB3EX121, and BB3EX127 and stockpile.
5-Jan-05	DTSC, Trust, NPS, T&R walk site to decide confirmation sampling results document site cleanup criteria met. Sampling complete.
11-Jan-05	Groundwater flow from seeps along toe of northern slope approximately 7 gpm, localized piping noted.
18-Jan-05	Load out last waste material, Class III from scraping. Bowley Road reopened.
	BBDA 3 Site Restoration
6-Dec-04	Submit preliminary Battery Crosby Road design to NPS for 5X Review.
24-Jan-05	Begin removal of temporary erosion control and construct final erosion control.
25-Jan-05	Install main seep collection dam and diversion pipe.
11-Feb-05	Submit three design alternatives for Battery Crosby Road to NPS for review and comment.
14-Feb-05	Final erosion control check dams complete.
15-Feb-05	Monitor erosion control following rains. Main seep pipes again.
22-Feb-05	Repair erosion control.
28-Feb-05	Monitor erosion control following rains. Main seep pipes again.
4-Mar-05	Monitor erosion control following rains. Main seep pipes again.
7-Mar-05	Repair Battery Crosby Road entrance guard rail.
14-Mar-05	Monitor erosion control following rains. Main seep pipes again.
16-Mar-05	Repair erosion control.
21-Mar-05	Monitor erosion control following rains.
23-Mar-05	Monitor erosion control following rains.
5-Apr-05	Monitor erosion control following rains.
14-Apr-05	Submit two design alternatives for Battery Crosby Road to NPS for review and comment.

Table 4
Construction Completion Timeline
Baker Beach Disturbed Areas 3 and 4
Presidio of San Francisco, California

25-Apr-05	Monitor erosion control following rains.
9-May-05	Monitor erosion control following rains
16-May-05	Submit one revised design alternative for Battery Crosby Road to NPS for review and comment
19-May-05	Monitor erosion control following rains
9-Jun-05	Monitor erosion control following rains
17-Jun-05	Monitor erosion control following rains
29-Jun-05	*As of this date, Battery Crosby Road design has not been finalized.*
BBDA 4 Excavation and Site Restoration	
5-Oct-04	Mobilize equipment to BBDA 4 and begin grubbing, stockpile material at BBDA 3.
7-Oct-04	Complete excavation at BBDA 4, de-mobilize equipment.
	T&R collects confirmation samples BB4EX100[0.5] through BB4EX107[0.5].
8-Oct-04	Loadout all BBDA 4 waste, Class II waste offhaul to Altamont, and Class III offhaul to Ox Mt.
11-Oct-04	Installation of final erosion control.
27-Oct-04	DTSC, NPS, Trust discuss site confirmation sample results.
4-Nov-05	BBDA 4 Complete.
15-Feb-05	Monitor erosion control following rains
28-Feb-05	Monitor erosion control following rains
4-Mar-05	Monitor erosion control following rains
14-Mar-05	Monitor erosion control following rains.
21-Mar-05	Monitor erosion control following rains
23-Mar-05	Monitor erosion control following rains
5-Apr-05	Monitor erosion control following rains
6-Apr-05	Seal surfacewater drainage invert at Battery Chamberlin Road, install asphalt "speed bump" for runoff diversion.
25-Apr-05	Monitor erosion control following rains
9-May-05	Monitor erosion control following rains
19-May-05	Monitor erosion control following rains
9-Jun-05	Monitor erosion control following rains
17-Jun-05	Monitor erosion control following rains

All "Accumulative Movement" listed are net change calculated between the original survey measurment (6/16/04) and the date of individual survey.

Sign Convention: Movement North +
Movement East +
Increase in Elevation +

Note: Movement of .01' or less is considered within the margin of acceptable measurement variability.

NOTES:
mg/kg - milligrams per kilogram
NA - Not Analyzed
Values in red/bold typeface indicate cleanup level exceedances.
Green shading indicates area was overexcavated.
1 Cleanup level from Cleanup Levels Document.
2 Pre-1958 Road Fill consists of a mixture of Colma, beach/dune sand, and serpentinite. Analytical results are compared against the cleanup level for serpentinite.
J : The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J- : The analyte was positively identified; the associated numerical value is biased low due to a low surrogate recovery and should be considered an approximate concentration of the analyte in the sample.
J+ : The analyte was positively identified; the associated numerical value is biased high due to a high surrogate recovery and should be considered an approximate concentration of the analyte in the sample.
UJ : The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
2,4-D - 2,4-Dichlorophenoxyacetic acid
2,4 DB - 4-(2,4-dichlorophenoxy) butyric acid
MCPA - (4-chloro-2-methylphenoxy) acetic acid
MCPP - 2-(2-Methyl-4-chlorophenoxy) propionic acid
2,4,5-T - (2,4,5-trichlorophenoxy) acetic acid

NOTES:
µg/kg - micrograms per kilogram
Values in red/bold typeface indicate cleanup level exceedances.
Green shading indicates area was overexcavated.
1 For this compound, in cases where the detection limit exceeds the cleanup level, the laboratory verified that the compound was not present between the Practical Quantification Limit (PQL) and the lower Method Detection Limit (MDL).
Therefore, if a detected or an estimated concentration is not reported, it can be assumed that the compound is not present at concentrations exceeding the MDL or the cleanup level.
2 Results for alpha-chlordane and gamma-chlordane are summed for comparison to the RAP cleanup level of 9 µg/kg.
3 Cleanup levels from Cleanup Levels Document.
4 Pre-1958 Road Fill consists of a mixture of Colma, beach/dune sand, and serpentinite. Analytical results are compared against the cleanup level for serpentinite.
5 Continuing Calibration Verification (CCV) drift outside limits; average CCV drift within limits per method requirements
b : The %D of the continuing calibration standards were outside acceptance limits
C : Presence confirmed, but RPD between columns exceeds 40%
J : Estimated Value
J- : The analyte was positively identified; the associated numerical value is biased low due to a low surrogate recovery and should be considered an approximate concentration of the analyte in the sample.
UJ : The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
: CCV drift outside limits; average CCV drift within limits per method requirements

Table 8
Summary of PCB Results in Soil Confirmation Samples
Baker Beach Disturbed Area 3
Presidio of San Francisco, California

NOTES:
µg/kg - micrograms per kilogram
Values in red/bold typeface indicate cleanup level exceedances.
Green shading indicates area was overexcavated.
1 Cleanup levels from Cleanup Levels Document.
2 Pre-1958 Road Fill consists of a mixture of Colma, beach/dune sand, and serpentinite. Analytical results are compared against the cleanup level for serpentinite.
UJ : The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Table 9
Remaining Metals Exceedances Rationale
Baker Beach Disturbed Area 3
Presidio of San Francisco, California

Sample ID and Lithology	Metal and Exceedance Concentration	Cleanup Level	Rationale
BB3EX128[0.5] *Colma*	Nickel: 150 mg/kg	Colma: 110 mg/kg	Based on a calculation of the 95% UCL of the mean, the remaining nickel concentrations at BBDA 3 as a whole, including this point, do not pose an unacceptable risk to human health or the environment. The result is considered acceptable for this sample.
BB3EX128[0.5] *Colma*	Selenium: 0.7 mg/kg	Colma: 0.5 mg/kg Sand: 0.75 mg/kg	This sample likely contains a mixture of sand and Colma soil, which results in an elevated selenium concentration relative to the cleanup level (CL) for Colma, but below the CL for sand. The result is considered acceptable for this sample.
BB3EX141 [2.5] *Pre-1958 Road Fill*	Vanadium: 91 mg/kg	Serpentinite: 74 mg/kg Sand: 92 mg/kg	This sample was collected from engineered fill underlying Battery Crosby Road. Based on visual inspection in the field, it likely contains a mixture of sand, Colma soil, and serpentinite, resulting in an elevated vanadium concentration relative to the CL for serpentinite, but below the CL for sand. The result is considered acceptable for this sample (95% Upper confidence limit [UCL] calculation also applies).
BB3EX141 [5.5] *Pre-1958 Road Fill*	Vanadium: 100 mg/kg	Serpentinite: 74 mg/kg Sand: 92 mg/kg	Based on a calculation of the 95% UCL of the mean, the remaining vanadium concentrations at BBDA 3 as a whole, including this point, do not pose an unacceptable risk to human health or the environment. The result is considered acceptable for this sample.
BB3EX151[0.5] *Chert*	Selenium: 0.72 mg/kg	Chert: 0.5 mg/kg	Based on a calculation of the 95% UCL of the mean, the remaining selenium concentrations at BBDA 3 as a whole, including this point, do not pose an unacceptable risk to human health or the environment. The result is considered acceptable for this sample.
BB3EX152[0.5] *Chert*	Selenium: 1.3 mg/kg	Chert: 0.5 mg/kg	Based on a calculation of the 95% UCL of the mean, the remaining selenium concentrations at BBDA 3 as a whole, including this point, do not pose an unacceptable risk to human health or the environment. The result is considered acceptable for this sample.

Notes
1) Samples BB3EX141[2.5] and BB3EX141[5.5] were logged as "Engineered Fill" and representative of pre-1958 road fill and consist of a mixture of beach/dune sand, Colma soil, and serpentinite.
2) Cleanup levels for chert presented in these tables were derived from the Cleanup Levels Document. Cleanup levels for beach/dune sand, Colma soil, and serpentinite are presented in the Remedial Action Plan (RAP) (Treadwell & Rollo, 2004a).

Table 10
Summary of TPH Results in Soil Confirmation Samples
Baker Beach Disturbed Area 3
Presidio of San Francisco, California

Sample ID	Sample Date	Lithology	TPH Diesel	TPH Fuel Oil
			mg/kg	mg/kg
Cleanup Levels		**Sand**	**700**	**980**
BB3EX108[0.5]	8/5/2004	Sand	2.3 Y	< 5.3

NOTES:
µg/kg - micrograms per kilogram
ND - Not detected; detection limits vary
NA - Not analyzed
VOC - Volatile organic compound
SVOC - Semi-volatile organic compound
Values in red/bold typeface indicate cleanup level exceedances.
Green shading indicates area was overexcavated.
1 For this compound, in cases where the detection limit exceed the cleanup level, the laboratory verified that the compound was not present between the Practical Quantification Limit (PQL) and the lower Method Detection Limit (MDL).
J : The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J- : The analyte was positively identified; the associated numerical value is biased low due to a low surrogate recovery and should be considered an approximate concentration of the analyte in the sample.

NOTES:
mg/kg - milligrams per kilogram
Values in red/bold typeface indicate cleanup level exceedances.
Green shading indicates area was overexcavated.
1 For this compound, in cases where the detection limit exceed the cleanup level, the laboratory verified that the compound was not present between the Practical Quantification Limit (PQL) and the lower Method Detection Limit (MDL). Therefore, if a detected or an estimated concentration is not reported, it can be assumed that the compound is not present at concentrations exceeding the MDL or the cleanup level.
U : The analyte was analyzed for, but was not detected above, the reported sample quantitation limit
2,4-D - 2,4-Dichlorophenoxyacetic acid
2,4 DB - 4-(2,4-dichlorophenoxy) butyric acid
MCPA - (4-chloro-2-methylphenoxy) acetic acid
MCPP - 2-(2-Methyl-4-chlorophenoxy) propionic acid
2,4,5-T - (2,4,5-trichlorophenoxy) acetic acid

Notes

[1] Weight, in tons, for each waste stream and each site is based on weight tickets or manifests (included in Appendix H).

[2] Volume, in cubic yards, for each waste stream is calculated by using a conversion factor. For BBDA 3, the conversion factor (units of tons per bank cubic yard) is calculated by dividing the total weight of materials excavated prior to the survey taken on 29 November 2004 (i.e., 88 tons of excavated wood waste; 4 tons of excavated tires; 1,740 tons of Class III waste; 11,447 tons of Class II waste; and 42,770 tons of Class I waste; a total of 56,049 tons) by the total volume of excavated materials (37,493 bank cy), as determined by the 29 November 2004 survey (shown as Figure 8). For BBDA 3, the conversion factor is therefore 1.495 tons/cy.

[3] Volume, in cubic yards, for each waste stream is calculated by using a conversion factor. For BBDA 4, the conversion factor (units of tons per bank cubic yard) is calcualted by dividing the total weight of materials excavated prior to the survey taken on 21 October 2004 (i.e., 85 tons of Class III waste; and 651 tons of Class II waste; a total of 736 tons) by the total volume of excavated material (452 bank cy), as determined by the 21 October 2004 survey (shown as Figure 9). For BBDA 4, the conversion factor is therefore 1.628 tons/cy. No materials were excavated or removed from BBDA 4 after the 21 October 2004 survey.

[4] The post-construction survey for BBDA 3 was completed on 29 November 2004; the final survey is pending the reconstruction of Battery Crosby Road. The final survey for BBDA 4 was completed on 21 October 2004.

[5] Two categories of material were removed from BBDA 3 after the 29 November 2004 survey: 615 tons of impacted Battery Crosby Road material which was excavated on 15 December 2004 and offhauled for Class II disposal on 16 and 17 December 2004 and 151 tons of surface soils overexcavated at the request of DTSC on 4 January 2005 and offhauled for Class III disposal on 18 January 2005.

[6] Prior to the commencement of remedial exavation, tree and brush removal activities were performed at BBDA 3. A total of 780 tons of green waste was chipped and recycled. This tonnage has not been included in the caluclation of the BBDA 3 conversion factor (Footnote 2), as it was not part of the 37,493 bank cy of material excavated according to the 29 November 2004 survey. However, the conversion factor of 1.495 tons/cy has been applied to provide an estimate of the volume of the recycled green waste (444 cy + 78 cy = 522 cy).

[7] Volume (bank cubic yards) of fill material removed, based on surveys dated 29 November 2004 (BBDA 3) and 21 October 2004 (BBDA 4) (Figures 8 and 9).

Notes
µg/kg - micrograms per kilogram
Values in red/bold typeface indicate cleanup level exceedances.
1 For this compound, in cases where the detection limit exceeds the cleanup level, the laboratory verified that the compound was not present between the Practical Quantification Limit (PQL) and the lower Method Detection Limit (MDL). Therefore, if a detected or an estimated concentration is not reported, it can be assumed that the compound is not present at concentrations exceeding the MDL or the cleanup level.
2 Results for alpha-chlordane and gamma-chlordane are summed for comparison to the RAP cleanup level of 9 µg/kg.
3 Continuing calibration verification (CCV) drift outside limits; average CCV drift within limits per method requirements
UJ : The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001.
2 - Piezometer was abandoned prior to the remedial action following Second Quarter 2004 in preparation for the remedial action.
3 - BB3PZ101 was formerly named BB3SW103.
4 - Groundwater cleanup levels were taken from the *Remedial Action Plan for Fill Site 6A and Baker Beach Disturbed Areas 3 and 4, Presidio of San Francisco, California* (Treadwell & Rollo, 2004a).
mg/L - milligrams per liter
NA - not analyzed
NM - not measured
J- : The analyte was positively identified; the associated numerical value is biased low due to a low surrogate recovery and should be considered an approximate concentration of the analyte in the sample.
UJ : The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

Table 22
Results of OCP and VOC Analyses
Baker Beach Disturbed Area 3
Presidio of San Francisco, California

Location ID	Sample Date	All OCPs	VOCs			
			Bromo-dichloro-methane	Bromoform	Dibromo-chloro-methane	All Other VOCs
	Analytical Method[1]	SW8081A	SW8260B/ SW8260M	SW8260B/ SW8260M	SW8260B/ SW8260M	SW8260B/ SW8260M
		(µg/L)	(µg/L)	(µg/L)	(µg/L)	(µg/L)
Cleanup Levels [3]		**--**	**80**	**--**	**0.4**	**--**
BB3PZ100A [2]	05/25/04	ND	< 0.5	< 1	< 0.5	ND
	03/18/04	ND	0.7	0.6 J	1.1	ND
BB3PZ100B [2]	05/25/04	ND	< 0.5	< 1	< 0.5	ND
	03/18/04	ND	< 0.5	< 1	< 0.5	ND
BB3SP100	05/01/00	ND	< 0.5 U	< 0.5 U	< 0.5 U	ND

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001.
2 - Piezometer was abandoned prior to the remedial action following Second Quarter 2004 in preparation for the remedial action.
3 - Groundwater cleanup levels were taken from the *Remedial Action Plan for Fill Site 6A and Baker Beach Disturbed Areas 3 and 4, Presidio of San Francisco, California* (Treadwell & Rollo, 2004a).
OCPs - organochlorine pesticides
VOCs - volatile organic compounds
µg/L - micrograms per liter
ND - not detected
U : The analyte was analyzed for, but was not detected above, the reported sample quantitation limit

Table 23
Results of TPH Analyses
Baker Beach Disturbed Area 3
Presidio of San Francisco, California

Location ID	Sample Date	TPH as Gasoline (Carbon Range C_7-C_{12})	TPH as Diesel (Carbon Range C_{12}-C_{24})	TPH as Fuel Oil (Carbon Range C_{24}-C_{36})
	Analytical Method[1]	SW8015B/ SW8015M	SW8015B/ SW8015M	SW8015B/ SW8015M
		(µg/L)	(µg/L)	(µg/L)
Cleanup Levels [3]		**443**	**880**	**1,200**
BB3GW100	12/14/04	< 50	< 50	< 300
BB3PZ101 [2]	12/16/04	< 50	< 50	< 300
BB3SW101	12/17/04	< 50	NA	NA
BB3SW102	12/17/04	< 50	< 50	< 300

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001.
2 - BB3PZ101 was formerly named BB3SW103.
3 - Groundwater cleanup levels were taken from the *Remedial Action Plan for Fill Site 6A and Baker Beach Disturbed Areas 3 and 4, Presidio of San Francisco, California* (Treadwell & Rollo, 2004a).
µg/L - micrograms per liter
TPH - total petroleum hydrocarbons
NA - not analyzed

Table 24
Results of Total and Dissolved Metals Analyses
Baker Beach Disturbed Area 3
Presidio of San Francisco, California

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001.
2 - Groundwater cleanup levels were taken from the *Remedial Action Plan for Fill Site 6A and Baker Beach Disturbed Areas 3 and 4, Presidio of San Francisco, California* (Treadwell & Rollo, 2004a).
3 - Piezometer was abandoned prior to the remedial action following Second Quarter 2004 in preparation for the remedial action.
4 - BB3PZ101 was formerly named BB3SW103.
5 - **Bold** numbers indicate concentrations which exceed RAP cleanup criteria. However, RAP cleanup criteria apply only to dissolved metals concentrations.
mg/L - milligrams per liter
µg/L - micrograms per liter
NA - not analyzed
All metal results represent dissolved metals, unless indicated as "total" in the left-hand column, for total metal results.
J: The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
J+ : The analyte was positively identified; the associated numerical value is biased high due to a high surrogate recovery and should be considered an approximate concentration of the analyte in the sample.
U: The analyte was analyzed for, but was not detected above, the reported sample quantitation limit

Notes

[1] The laboratory report for Sample Delivery Group 176656 also contains analytical results for sample BB3-CLLAB, which is not a confirmation soil sample. BB3-CLLAB is a characterization sample that was collected from an off-site quarried lava rock material that may be used in the future for road reconstruction efforts, therefore the analytical results for this sample are not formally presented in this report.

CASE NARRATIVE

This hardcopy data package contains sample results and batch QC results for one soil sample received from the above referenced project. The sample was received cold and intact.

Organochlorine Pesticides: Sample BB3EX100[0.5] (173741-001) required a five-fold dilution due to the dark and oily nature of the sample extract. No target compounds were detected at the dilution.

The matrix spike recoveries for gamma-BHC and dieldrin, and the matrix spike duplicate recoveries for all compounds except heptachlor, were outside acceptance limits. The associated laboratory control sample (LCS) recoveries were acceptable and the spiked sample was not from this site.

The %RSD of the initial calibration of GC16 on 7/29/04 for alpha-BHC from channel A was outside acceptance limits. The associated average %RSD for all compounds was acceptable on both channels, therefore, there is no affect on the quality of the sample results.

The %D of the continuing calibration standard (CCS) 212_022 was outside acceptance limits for several individual compounds. The affected compounds have been flagged with a "b" as per the method. The associated average %D for all compounds was acceptable on both channels, therefore, there is no affect on the quality of the sample results. No other analytical problems were encountered.

PCBs: No analytical problems were encountered.

Metals: The matrix spike recoveries for antimony were below acceptance limits. The associated blank spike recoveries were acceptable and the spiked sample was not from this site.

The serial dilution sample analyzed on 8/2/04 at 07:40 was outside acceptance limits for selenium. No other analytical problems were encountered.

COOLER RECEIPT CHECKLIST

Login#: Treadwell & Rolb Date Received: 7-30-04 Number of Coolers: 1
Client: 173741 Project: 2893.12

A. Preliminary Examination Phase
Date Opened: 7-30-04 By (print): Troy Windsor (sign) [signature]

1. Did cooler come with a shipping slip (airbill, etc.)? ..... YES NO
   If YES, enter carrier name and airbill number: _____
2. Were custody seals on outside of cooler? ..... YES NO
   How many and where? _____ Seal date: _____ Seal name: _____
3. Were custody seals unbroken and intact at the date and time of arrival? ..... YES NO N/A
4. Were custody papers dry and intact when received? ..... YES NO
5. Were custody papers filled out properly (ink, signed, etc.)? ..... YES NO
6. Did you sign the custody papers in the appropriate place? ..... YES NO
7. Was project identifiable from custody papers? ..... YES NO
   If YES, enter project name at the top of this form.
8. If required, was sufficient ice used? Samples should be 2-6 degrees C. ..... YES NO
   Type of ice: Blue Temperature: Cold

B. Login Phase
Date Logged In: 7-30-04 By (print): Troy Windsor (sign) [signature]

1. Describe type of packing in cooler: In plastic Ziploc type bag
2. Did all bottles arrive unbroken? ..... YES NO
3. Were labels in good condition and complete (ID, date, time, signature, etc.)? ..... YES NO
4. Did bottle labels agree with custody papers? ..... YES NO
5. Were appropriate containers used for the tests indicated? ..... YES NO
6. Were correct preservatives added to samples? ..... YES NO N/A
7. Was sufficient amount of sample sent for tests indicated? ..... YES NO
8. Were bubbles absent in VOA samples? If NO, list sample Ids below ..... YES NO N/A
9. Was the client contacted concerning this sample delivery? ..... YES NO
   If YES, give details below.
   Who was called? _____ By whom? _____ Date: _____

CASE NARRATIVE

This hardcopy data package contains sample results and batch QC results for five soil samples received from the above referenced project. The samples were received cold and intact.

Organochlorine Pesticides: The %RSD of the initial calibration of GC16 on 7/29/04 for alpha-BHC from channel A was outside acceptance limits. The associated average %RSD for all compounds was acceptable on both channels, therefore, there is no affect on the quality of the sample results.

The %D of the continuing calibration standard (CCS) 217_030 was outside acceptance limits for several individual compounds. The affected compounds have been flagged with a "b" as per the method. The associated average %D for all compounds was acceptable on both channels, therefore, there is no affect on the quality of the sample results. No other analytical problems were encountered.

PCBs: The TCMX surrogate recoveries for all samples were above acceptance limits. The associated decachlorobiphenyl surrogate recoveries were acceptable, therefore, there is no affect on the quality of the sample results. No other analytical problems were encountered.

Metals: The matrix spike recoveries for antimony, barium, copper, and vanadium, and the matrix spike duplicate recoveries for antimony, barium, and chromium, were outside acceptance limits. The associated blank spike recoveries were acceptable and the spiked sample was not from this site.

The serial dilution sample analyzed on 8/3/04 at 10:41 was outside acceptance limits for arsenic. No other analytical problems were encountered.

COOLER RECEIPT CHECKLIST

Login#: 173773 Date Received: 8/2/04 Number of Coolers: 1
Client: Treadwell + Rollo Project: Presidio Baker Beach 3

A. Preliminary Examination Phase
Date Opened: 8/2/04 By (print): Peter P. (sign) [signature]

1. Did cooler come with a shipping slip (airbill, etc.)? ..... YES (NO)
   If YES, enter carrier name and airbill number: _____
2. Were custody seals on outside of cooler? ..... YES (NO)
   How many and where? _____ Seal date: _____ Seal name: _____
3. Were custody seals unbroken and intact at the date and time of arrival? ..... YES NO N/A
4. Were custody papers dry and intact when received? ..... (YES) NO
5. Were custody papers filled out properly (ink, signed, etc.)? ..... (YES) NO
6. Did you sign the custody papers in the appropriate place? ..... (YES) NO
7. Was project identifiable from custody papers? ..... (YES) NO
   If YES, enter project name at the top of this form.
8. If required, was sufficient ice used? Samples should be 2-6 degrees C. ..... (YES) NO
   Type of ice: WET Temperature: COLD

B. Login Phase
Date Logged In: 8/2/04 By (print): Peter P. (sign) [signature]

1. Describe type of packing in cooler: Zip Lockbag
2. Did all bottles arrive unbroken? ..... (YES) NO
3. Were labels in good condition and complete (ID, date, time, signature, etc.)? ..... (YES) NO
4. Did bottle labels agree with custody papers? ..... (YES) NO
5. Were appropriate containers used for the tests indicated? ..... (YES) NO
6. Were correct preservatives added to samples? ..... YES NO N/A
7. Was sufficient amount of sample sent for tests indicated? ..... (YES) NO
8. Were bubbles absent in VOA samples? If NO, list sample Ids below ..... YES NO N/A
9. Was the client contacted concerning this sample delivery? ..... YES NO
   If YES, give details below.
   Who was called? _____ By whom? _____ Date: _____

	Mfg & Lot # / Time / Program	Initials / Date
☒ Extracts were cleaned up using Florisil cartridges	Resprep 204120-AQ	BB 8/3/04
Florisil cartridges/ columns rinsed 3x with Hexane	✓ RJCK 898	
Extracts were eluted with 9 mL 9:1 Hexane/Acetone — Hexane	✓	
Acetone	EM43350	
Concentrated to volumes as noted above	✓

CASE NARRATIVE

This hardcopy data package contains sample results and batch QC results for one soil sample received from the above referenced project. The sample was received cold and intact.

Organochlorine Pesticides: The endrin breakdown % for the performance evaluation monitoring standards (PEMs) were above acceptance limits on channel A. Endrin and its associated breakdown products were not detected in the associated sample, therefore, there is no affect on the quality of the sample results.

The %D of the continuing calibration standard (CCS) 217_024 was outside acceptance limits for decachlorobiphenyl on channel B. The associated average %D for all compounds was acceptable on both channels, therefore, there is no affect on the quality of the sample results. No other analytical problems were encountered.

PCBs: The TCMX surrogate recoveries for all samples were above acceptance limits. The associated decachlorobiphenyl surrogate recoveries were acceptable, therefore, there is no affect on the quality of the sample results. No other analytical problems were encountered.

Metals: The matrix spike recoveries for antimony, chromium, and nickel, the matrix spike duplicate recovery for antimony, and the matrix spike duplicate relative percent difference (RPD) for chromium, were outside acceptance limits. The associated blank spike recoveries and blank spike duplicate RPDs were acceptable for all target elements and the spiked sample was not from this site. No other analytical problems were encountered.

COOLER RECEIPT CHECKLIST

Login#: 173825 Date Received: 8/4/04 Number of Coolers: 1
Client: Treadwell+Rollo Project: Presidio - Baker Beach 3

A. Preliminary Examination Phase
Date Opened: 8/4/04 By (print): Peter P. (sign) [signature]

1. Did cooler come with a shipping slip (airbill, etc.)?..... YES NO
   If YES, enter carrier name and airbill number:
2. Were custody seals on outside of cooler?..... YES NO
   How many and where? Seal date: Seal name:
3. Were custody seals unbroken and intact at the date and time of arrival?..... YES NO N/A
4. Were custody papers dry and intact when received?..... YES NO
5. Were custody papers filled out properly (ink, signed, etc.)?..... YES NO
6. Did you sign the custody papers in the appropriate place?..... YES NO
7. Was project identifiable from custody papers?..... YES NO
   If YES, enter project name at the top of this form.
8. If required, was sufficient ice used? Samples should be 2-6 degrees C. ..... YES NO
   Type of ice: WET Temperature: COLD

B. Login Phase
Date Logged In: 8/4/04 By (print): Peter P. (sign) [signature]

1. Describe type of packing in cooler: zip loc bag
2. Did all bottles arrive unbroken?..... YES NO
3. Were labels in good condition and complete (ID, date, time, signature, etc.)?.. YES NO
4. Did bottle labels agree with custody papers?..... YES NO
5. Were appropriate containers used for the tests indicated?..... YES NO
6. Were correct preservatives added to samples?..... YES NO N/A
7. Was sufficient amount of sample sent for tests indicated?..... YES NO
8. Were bubbles absent in VOA samples? If NO, list sample Ids below..... YES NO N/A
9. Was the client contacted concerning this sample delivery?..... YES NO
   If YES, give details below.
   Who was called? By whom? Date:

CASE NARRATIVE
CHLORINATED HERBICIDES (EPA 8151)

Laboratory number:	173857
Client:	Treadwell & Rollo
Project:	2893.12
Location:	Presidio - Baker Beach 3
Request Date:	08/05/04
Samples Received:	08/05/04

This hardcopy data package contains sample and batch QC results for two soil samples, requested for the above referenced project on 08/05/04. The samples were received cold and intact.

APCL in Chino, CA performed the analysis. Please see the APCL case narrative.

COOLER RECEIPT CHECKLIST

Login#: 173857 Date Received: 8-5-04 Number of Coolers: 1
Client: Treadwell & Rollo Project: 2893.12

A. Preliminary Examination Phase
Date Opened: 8-5-04 By (print): Tray Windsor (sign) Tray E. Windsor

1. Did cooler come with a shipping slip (airbill, etc.)? ..... YES (NO)
   If YES, enter carrier name and airbill number: _____
2. Were custody seals on outside of cooler? ..... YES (NO)
   How many and where? _____ Seal date: _____ Seal name: _____
3. Were custody seals unbroken and intact at the date and time of arrival? ..... YES NO N/A
4. Were custody papers dry and intact when received? ..... (YES) NO
5. Were custody papers filled out properly (ink, signed, etc.)? ..... (YES) NO
6. Did you sign the custody papers in the appropriate place? ..... (YES) NO
7. Was project identifiable from custody papers? ..... (YES) NO
   If YES, enter project name at the top of this form.
8. If required, was sufficient ice used? Samples should be 2-6 degrees C. ..... (YES) NO
   Type of ice: wet Temperature: cold – no temp blank

B. Login Phase
Date Logged In: 8-5-04 By (print): Tray Windsor (sign) Tray E. Windsor

1. Describe type of packing in cooler: In ziploc bags
2. Did all bottles arrive unbroken? ..... (YES) NO
3. Were labels in good condition and complete (ID, date, time, signature, etc.)? ..... (YES) NO
4. Did bottle labels agree with custody papers? ..... (YES) NO
5. Were appropriate containers used for the tests indicated? ..... (YES) NO
6. Were correct preservatives added to samples? ..... YES NO N/A
7. Was sufficient amount of sample sent for tests indicated? ..... (YES) NO
8. Were bubbles absent in VOA samples? If NO, list sample Ids below ..... YES NO N/A
9. Was the client contacted concerning this sample delivery? ..... YES NO
   If YES, give details below.
   Who was called? _____ By whom? _____ Date: _____

Case Narrative

Project: Presidio-Baker Beach 3/173857

For Curtis & Tompkins

APCL Service No: 04-3977

1. Sample Identification

The sample identifications are listed in the following table:

Curtis & Tompkins Sample ID	APCL Sample ID
BB3EX108(0.5)	04-03977-1
EUP080504A	04-03977-2

2. Analytical Methodology

Samples are analyzed by EPA methods

8151A (Chlorinated herbicides),
ASTM-D2216 (Moisture, percent in soil),

3. Holding Time

All samples were extracted, digested and analyzed within the holding times defined by the appropriate EPA methods of the analyses.

4. Preservation

All samples were preserved and stored according to the appropriate EPA methods.

5. Tele-log

None

6. Anomaly

None

"I certify that these data are technically accurate, complete, and in compliance with the terms and conditions of the contract, for other than the conditions detailed above. Release of the data contained in the hardcopy data package and its electronic data deliverable submitted on diskette had been authorized by the Laboratory Manager or her/his designee, as verified by the following signature."

Surrogates		Control Limit, %	Surro. Rec.%
1 2,4-DICHLOROPHENYLACETIC ACID	19719-28-9	65-135	79
# of out-of-control			0

Internal Standard		Control Limit, %	IS Rec.%
1 4,4'-DIBROMOOCTAFLUOROBIPHENYL	10386-84-2	50-200	104
# of out-of-control			0

Not Detected is shown as PQL, with dilution and moisture corrected if applicable.

Qualifier: U - Not Detected or less than MDL
J - Less than RL (PQL, EQL or CRDL), but greater than MDL, or an estimated result (e.g. for TIC)
E - Exceed calibration range
B - A positive value was found in the method blank
D - Diluted

Total $F = 2\ f_1\ f_>$ or $f_1\ f_2$		0.20	→	→	→	→		

† Extraction Anomaly Footnote:
1. Difficult to concentrate to 1.0 mL.
2. Extract is dark color
3. Extract is sticky
4. Heterogenous matrix.
5. Too much precipitate during extraction.
6. There is an oil layer above the sample.
7. Mixture of soil & water.
8. BN-extract is interfered, A-extract only.
9. Sample has strong stink
10. Some solvent suspected
11. special color, specify

* For double extract analysis (ABN), $f_> = \max[f_A, f_B]$ and $f_< = \min[f_A, f_B]$, where f_A, f_B are f_1 for A and BN extracts, respectively. The values in () is the typical case for 625/8270 ABN analysis.

APCL form 7-122 (old 5-110), Ver. 3.0 April 5, 1996. No pencil. Use blue pen for record. Use red pen for correction.

Analysis Anomaly Record

Batch #: 0404 3146 Method: 8251 Matrix: S Date: 8-9-4

Samples Involved: 3977 . 3983

- **Anomaly for MS/MSD/MD**
  - ☐ 1. MS/MSD out of control limit, sample matrix interference suspected
  - ☐ 2. MS or MSD out of control limit, but $\overline{MS}$ is O.K.
  - ☐ 3. One of MS/MSD, and $\overline{MS}$ out of control limit, but not enough sample for re-analysis
  - ☒ 4. Not enough sample for MS/MSD, LCS/LCSD may be used
  - ☐ 5. Spiked samples contain high concentration of analytes (>4 × spiked concentration)
  - ☐ 6. MS/MSD out of control limit, but post spike is O.K.
  - ☐ 7. MS/MSD out of control limit, due to the heterogenous matrix
  - ☐ 8. MS/MSD out of control limit, due to the very special matrix
  - ☐ 9. Not enough sample for matrix duplicate (MD)
- **Anomaly for Holding time (HT)**
  - ☐ 10. HT has been exceeded when received, authorized by the Client to carry on with the analyses
  - ☐ 11. Extraction HT was passed, authorized by the Client to carry on with the analyses
  - ☐ 12. Analysis HT was passed, authorized by the Client to carry on with the analyses
- **Surrogates Anomaly**
  - ☐ 13. Surrogate recovery out of control limit (see Level-1 Part III), sample matrix interference suspected
  - ☐ 14. Surrogate recovery out of control limit (see Level-1 Part III), but not enough sample for re-analysis
  - ☐ 15. Surrogate recovery out of control limit, due to very special matrix
  - ☐ 16. Surrogate diluted out (for highly contaminated samples)
  - ☐ 17. Lower surrogate recovery due to cleanup process
- **Chromatogram Pattern Anomaly**
  - ☐ 18. Not a typical gasoline chromatogram pattern
  - ☐ 19. Not a typical diesel chromatogram pattern
  - ☐ 20. Not a typical diesel chromatogram pattern, but similar to heavy-oil or motor oil
  - ☐ 21. Not a typical kerosene chromatogram pattern
  - ☐ 22. Not a typical jet fuel chromatogram pattern
  - ☐ 23. Not a complete PCB chromatogram pattern, interference/degration suspected
- **Other anomaly**

CASE NARRATIVE
METALS (EPA 6010B AND EPA 7470A)

Laboratory number:	173857
Client:	Treadwell & Rollo
Project:	2893.12
Location:	Presidio - Baker Beach 3
Request Date:	08/05/04
Samples Received:	08/05/04

This hardcopy data package contains sample and batch QC results for two soil samples, requested for the above referenced project on 08/05/04. The samples were received cold and intact.

Low recoveries were observed for a number of analytes in the MS/MSD for batch 93529; the parent sample was not a project sample, and the BS/BSD were within limits. High recoveries were observed for chromium; the BS/BSD were within limits. High RPD was observed for copper; the RPD was acceptable in the BS/BSD.

No other analytical problems were encountered.

COOLER RECEIPT CHECKLIST

Login#: 173857 Date Received: 8-5-04 Number of Coolers: 1
Client: Treadwell & Rollo Project: 2893.12

A. Preliminary Examination Phase
Date Opened: 8-5-04 By (print): Tray Windsor (sign) Tray E Windsor

1. Did cooler come with a shipping slip (airbill, etc.)? ..... YES NO
   If YES, enter carrier name and airbill number: _____
2. Were custody seals on outside of cooler? ..... YES NO
   How many and where? _____ Seal date: _____ Seal name: _____
3. Were custody seals unbroken and intact at the date and time of arrival? ..... YES NO N/A
4. Were custody papers dry and intact when received? ..... YES NO
5. Were custody papers filled out properly (ink, signed, etc.)? ..... YES NO
6. Did you sign the custody papers in the appropriate place? ..... YES NO
7. Was project identifiable from custody papers? ..... YES NO
   If YES, enter project name at the top of this form.
8. If required, was sufficient ice used? Samples should be 2-6 degrees C ..... YES NO
   Type of ice: wet Temperature: cold – no temp blank

B. Login Phase
Date Logged In: 8-5-04 By (print): Tray Windsor (sign) Tray E Windsor

1. Describe type of packing in cooler: In ziploc bags
2. Did all bottles arrive unbroken? ..... YES NO
3. Were labels in good condition and complete (ID, date, time, signature, etc.)? ..... YES NO
4. Did bottle labels agree with custody papers? ..... YES NO
5. Were appropriate containers used for the tests indicated? ..... YES NO
6. Were correct preservatives added to samples? ..... YES NO N/A
7. Was sufficient amount of sample sent for tests indicated? ..... YES NO
8. Were bubbles absent in VOA samples? If NO, list sample Ids below ..... YES NO N/A
9. Was the client contacted concerning this sample delivery? ..... YES NO
   If YES, give details below.
   Who was called? _____ By whom? _____ Date: _____

CASE NARRATIVE
PCBS (EPA 8082)

Laboratory number:	173857
Client:	Treadwell & Rollo
Project:	2893.12
Location:	Presidio - Baker Beach 3
Request Date:	08/05/04
Samples Received:	08/05/04

This hardcopy data package contains sample and batch QC results for two soil samples, requested for the above referenced project on 08/05/04. The samples were received cold and intact.

No analytical problems were encountered.

COOLER RECEIPT CHECKLIST

Login#: 173857 Date Received: 8-5-04 Number of Coolers: 1
Client: Treadwell & Rollo Project: 2893.12

A. Preliminary Examination Phase
Date Opened: 8-5-04 By (print): Troy Windsor (sign) Troy E Windsor

1. Did cooler come with a shipping slip (airbill, etc.)? ..... YES (NO)
   If YES, enter carrier name and airbill number: _____
2. Were custody seals on outside of cooler? ..... YES (NO)
   How many and where? _____ Seal date: _____ Seal name: _____
3. Were custody seals unbroken and intact at the date and time of arrival? ..... YES NO N/A
4. Were custody papers dry and intact when received? ..... (YES) NO
5. Were custody papers filled out properly (ink, signed, etc.)? ..... (YES) NO
6. Did you sign the custody papers in the appropriate place? ..... (YES) NO
7. Was project identifiable from custody papers? ..... (YES) NO
   If YES, enter project name at the top of this form.
8. If required, was sufficient ice used? Samples should be 2-6 degrees C ..... (YES) NO
   Type of ice: wet Temperature: cold – no temp blank

B. Login Phase
Date Logged In: 8-5-04 By (print): Troy Windsor (sign) Troy E Windsor

1. Describe type of packing in cooler: In ziploc bags
2. Did all bottles arrive unbroken? ..... (YES) NO
3. Were labels in good condition and complete (ID, date, time, signature, etc.)? ..... (YES) NO
4. Did bottle labels agree with custody papers? ..... (YES) NO
5. Were appropriate containers used for the tests indicated? ..... (YES) NO
6. Were correct preservatives added to samples? ..... YES NO N/A
7. Was sufficient amount of sample sent for tests indicated? ..... (YES) NO
8. Were bubbles absent in VOA samples? If NO, list sample Ids below ..... YES NO N/A
9. Was the client contacted concerning this sample delivery? ..... YES NO
   If YES, give details below.
   Who was called? _____ By whom? _____ Date: _____

Global Sample Information

Default Sample Volume : 1.000 ul
Quantitation Units : ng
Void Time : 0.000 min
Correct amounts during calibration : No
Convert unknowns to concentration units : Yes
Reject outliers during calibration : No

An External Standard calibration will be used
Unknown peaks will be quantitated using a response factor of 1.000000e+06
First peak will be relative retention reference
Send Peak Area results to LIMS

DM 8/3/04

CW 8/3/04

Component Information

Created by : analyst on: 8/3/04 9:30:54 AM
Edited by : analyst on: 8/3/04 10:07:29 AM
Number of Times Edited : 7
Number of Times Calibrated : 172
Description: gc 06

Global Sample Information
Default Sample Volume : 1.000 ul
Quantitation Units : ng
Void Time : 0.000 min
Correct amounts during calibration : No
Convert unknowns to concentration units : Yes
Reject outliers during calibration : No

An External Standard calibration will be used
Unknown peaks will be quantitated using a response factor of 1.000000e+06
First peak will be relative retention reference

AB 8/3/04

CW 8/3/04

Component Information
TCMX
Component Type : Single Peak Component
Retention Time : 6.640 min
Search Window : 3.00 s, 0.00 %
This component is a reference
Find peak closest to expected RT in window
Use Average Calibration Factor (Area / Amount)
Component standard purity percentage : 100.0000%

User Values

Printed by : analyst on: 8/9/04 9:42:25 AM
Created by : analyst on: 8/9/04 9:02:09 AM
Edited by : analyst on: 8/9/04 9:39:49 AM
Number of Times Edited : 4
Number of Times Calibrated : 126
Description: GC23

Global Sample Information

Default Sample Volume : 1.000 ul
Quantitation Units : ng
Void Time : 0.000 min
Correct amounts during calibration : No
Convert unknowns to concentration units : Yes
Reject outliers during calibration : No

Mcs 8/8/04

An External Standard calibration will be used
Unknown peaks will be quantitated using a response factor of 1.000000e+06
First peak will be relative retention reference

Component Information

TCMX
Component Type : Single Peak Component
Retention Time : 8.452 min
Search Window : 3.00 s, 0.00 %
Reference Component :

Edited by : analyst on: 8/9/04 9:41:10 AM
Number of Times Edited : 3
Number of Times Calibrated : 116
Description: GC 23

Global Sample Information
Default Sample Volume : 1.000 ul
Quantitation Units : ng
Void Time : 0.000 min
Correct amounts during calibration : No
Convert unknowns to concentration units : Yes
Reject outliers during calibration : No

JMW 8/9/04

An External Standard calibration will be used
Unknown peaks will be quantitated using a response factor of 1.000000e+06
First peak will be relative retention reference

Component Information
TCMX
Component Type : Single Peak Component
Retention Time : 8.423 min
Search Window : 3.00 s, 0.00 %
Reference Component :
Find peak closest to expected RT in window
Use Average Calibration Factor (Area / Amount)
Component standard purity percentage : 100.0000%

CASE NARRATIVE
VOLATILE ORGANICS BY GC/MS (EPA 8260B)

Laboratory number:	173857
Client:	Treadwell & Rollo
Project:	2893.12
Location:	Presidio - Baker Beach 3
Request Date:	08/05/04
Samples Received:	08/05/04

This hardcopy data package contains sample and batch QC results for two soil samples, requested for the above referenced project on 08/05/04. The samples were received cold and intact.

No analytical problems were encountered.

COOLER RECEIPT CHECKLIST

Login#: 173857 Date Received: 8-5-04 Number of Coolers: 1
Client: Treadwell & Rollo Project: 2893.12

A. Preliminary Examination Phase
Date Opened: 8-5-04 By (print): Tray Windsor (sign) Tray E Windsor

1. Did cooler come with a shipping slip (airbill, etc.)? ..... YES (NO)
   If YES, enter carrier name and airbill number: _____
2. Were custody seals on outside of cooler? ..... YES (NO)
   How many and where? _____ Seal date: _____ Seal name: _____
3. Were custody seals unbroken and intact at the date and time of arrival? ..... YES NO N/A
4. Were custody papers dry and intact when received? ..... (YES) NO
5. Were custody papers filled out properly (ink, signed, etc.)? ..... (YES) NO
6. Did you sign the custody papers in the appropriate place? ..... (YES) NO
7. Was project identifiable from custody papers? ..... (YES) NO
   If YES, enter project name at the top of this form.
8. If required, was sufficient ice used? Samples should be 2-6 degrees C ..... (YES) NO
   Type of ice: wet Temperature: cold – no temp blank

B. Login Phase
Date Logged In: 8-5-04 By (print): Tray Windsor (sign) Tray E Windsor

1. Describe type of packing in cooler: In ziploc bags
2. Did all bottles arrive unbroken? ..... (YES) NO
3. Were labels in good condition and complete (ID, date, time, signature, etc.)? ..... (YES) NO
4. Did bottle labels agree with custody papers? ..... (YES) NO
5. Were appropriate containers used for the tests indicated? ..... (YES) NO
6. Were correct preservatives added to samples? ..... YES NO N/A
7. Was sufficient amount of sample sent for tests indicated? ..... (YES) NO
8. Were bubbles absent in VOA samples? If NO, list sample Ids below ..... YES NO N/A
9. Was the client contacted concerning this sample delivery? ..... YES NO
   If YES, give details below.
   Who was called? _____ By whom? _____ Date: _____

34 2-Chloroethylvinylether

Concentration: 0.1690 UG/L

Data File: \\GCMSSERVER\DD\chem\MSVOA06.i\080504.b\FH505.D

Date : 05-AUG-2004 11:56

Client ID: DYNA P&T

Instrument: MSVOA06.i

Sample Info: MB,QC260268

Purge Volume: 5.0

Operator: VOA

Column phase: RTx Volatiles

Column diameter: 0.32

76 Naphthalene

Concentration: 0.1599 UG/L

Data File: \\GCMSSERVER\DD\chem\MSVOA06.i\080504.b\FH505.D

CASE NARRATIVE
SEMIVOLATILE ORGANICS BY GC/MS (EPA 8270C)

Laboratory number:	173857
Client:	Treadwell & Rollo
Project:	2893.12
Location:	Presidio - Baker Beach 3
Request Date:	08/05/04
Samples Received:	08/05/04

This hardcopy data package contains sample and batch QC results for two soil samples, requested for the above referenced project on 08/05/04. The samples were received cold and intact.

Low response was observed for 4-nitroaniline in the ICV analyzed 07/16/04 14:14; this analyte was not detected in the associated samples.

No other analytical problems were encountered.

COOLER RECEIPT CHECKLIST

Login#: 173857 Date Received: 8-5-04 Number of Coolers: 1
Client: Treadwell & Rollo Project: 2893.12

A. Preliminary Examination Phase
Date Opened: 8-5-04 By (print): Troy Windsor (sign) Troy E. Windsor

1. Did cooler come with a shipping slip (airbill, etc.)? ..... YES (NO)
   If YES, enter carrier name and airbill number: _____
2. Were custody seals on outside of cooler? ..... YES (NO)
   How many and where? _____ Seal date: _____ Seal name: _____
3. Were custody seals unbroken and intact at the date and time of arrival? ..... YES NO N/A
4. Were custody papers dry and intact when received? ..... (YES) NO
5. Were custody papers filled out properly (ink, signed, etc.)? ..... (YES) NO
6. Did you sign the custody papers in the appropriate place? ..... (YES) NO
7. Was project identifiable from custody papers? ..... (YES) NO
   If YES, enter project name at the top of this form.
8. If required, was sufficient ice used? Samples should be 2-6 degrees C ..... (YES) NO
   Type of ice: wet Temperature: cold – no temp blank

B. Login Phase
Date Logged In: 8-5-04 By (print): Troy Windsor (sign) Troy E. Windsor

1. Describe type of packing in cooler: In ziploc bags
2. Did all bottles arrive unbroken? ..... (YES) NO
3. Were labels in good condition and complete (ID, date, time, signature, etc.)? ..... (YES) NO
4. Did bottle labels agree with custody papers? ..... (YES) NO
5. Were appropriate containers used for the tests indicated? ..... (YES) NO
6. Were correct preservatives added to samples? ..... YES NO N/A
7. Was sufficient amount of sample sent for tests indicated? ..... (YES) NO
8. Were bubbles absent in VOA samples? If NO, list sample Ids below ..... YES NO N/A
9. Was the client contacted concerning this sample delivery? ..... YES NO
   If YES, give details below.
   Who was called? _____ By whom? _____ Date: _____

Method : \\GCMSSERVER\DD\chem\MSBNA03.i\071604.b\6PTBNA3.m
Meth Date : 16-Jul-2004 15:12 target Quant Type: ISTD
Cal Date : 16-JUL-2004 13:38 Cal File: VGG10.D
Als bottle: 9 Calibration Sample, Level: 7
Dil Factor: 1.00000
Integrator: HP RTE Compound Sublist: all.sub
Target Version: 4.10
Processing Host: PC_MSBNA03

Concentration Formula: Amt * DF * Uf * Vt/(Vo * Vi) * CpndVariable

Name	Value	Description
DF	1.000	Dilution Factor
Uf	1.000	ng unit correction factor
Vt	1000.000	Volume of final extract (uL)
Vo	1000.000	Volume of sample extracted (mL)
Vi	1.000	Volume injected (uL)
Cpnd Variable		Local Compound Variable

CASE NARRATIVE
TPH-EXTRACTABLES BY GC (EPA 8015B)

Laboratory number:	173857
Client:	Treadwell & Rollo
Project:	2893.12
Location:	Presidio - Baker Beach 3
Request Date:	08/05/04
Samples Received:	08/05/04

This hardcopy data package contains sample and batch QC results for two soil samples, requested for the above referenced project on 08/05/04. The samples were received cold and intact.

Low recoveries were observed for diesel C12-C24 in the MS/MSD for batch 93629; the parent sample was not a project sample, and the LCS was within limits.

No other analytical problems were encountered.

COOLER RECEIPT CHECKLIST

Login#: 173857 Date Received: 8-5-04 Number of Coolers: 1
Client: Treadwell & Rollo Project: 2893.12

A. Preliminary Examination Phase
Date Opened: 8-5-04 By (print): Tray Windsor (sign) Tray E Windsor

1. Did cooler come with a shipping slip (airbill, etc.)? ..... YES NO
   If YES, enter carrier name and airbill number: _____
2. Were custody seals on outside of cooler? ..... YES NO
   How many and where? _____ Seal date: _____ Seal name: _____
3. Were custody seals unbroken and intact at the date and time of arrival? ..... YES NO N/A
4. Were custody papers dry and intact when received? ..... YES NO
5. Were custody papers filled out properly (ink, signed, etc.)? ..... YES NO
6. Did you sign the custody papers in the appropriate place? ..... YES NO
7. Was project identifiable from custody papers? ..... YES NO
   If YES, enter project name at the top of this form.
8. If required, was sufficient ice used? Samples should be 2-6 degrees C. ..... YES NO
   Type of ice: wet Temperature: cold – no temp blank

B. Login Phase
Date Logged In: 8-5-04 By (print): Tray Windsor (sign) Tray E Windsor

1. Describe type of packing in cooler: In ziploc bags
2. Did all bottles arrive unbroken? ..... YES NO
3. Were labels in good condition and complete (ID, date, time, signature, etc.)? ..... YES NO
4. Did bottle labels agree with custody papers? ..... YES NO
5. Were appropriate containers used for the tests indicated? ..... YES NO
6. Were correct preservatives added to samples? ..... YES NO N/A
7. Was sufficient amount of sample sent for tests indicated? ..... YES NO
8. Were bubbles absent in VOA samples? If NO, list sample Ids below ..... YES NO N/A
9. Was the client contacted concerning this sample delivery? ..... YES NO
   If YES, give details below.
   Who was called? _____ By whom? _____ Date: _____

	Mfg & Lot # / LIMS # / Time	Date/Initials
Sand weighed out for QC samples	EM433104 10	BB/AMS 8/10/04
Samples were dried with CH2Cl2-rinsed granular Na2SO4	BMB 08/10/04 5TBA17H50	
1.0 mL of TEH_SURR surrogate solution was added to all samples	04WS1409C	
1.0 mL of TEH_SP matrix spiking solution was added to all spikes	04WS1464A	
≥ 75 mL of 1+1 (CH_2Cl_2+Acetone) was added to all CH_2Cl_2	44199	
Acetone	44179	
Samples were: ☐ sonicated 3 times ☒ placed on shaker table at:	1100	
taken off shaker table at:	1300	
Extracts filtered through baked, rinsed powdered Na_2SO_4	5TBA17H50	
Concentrated to volumes as noted above	✓	AMS 8/10/04
